## Reduced Syllabus Chemistry

## Class XII

(2020-21) (Theory)
Time: 3 Hours
70 Marks

| Unit No. | Title | No. of Periods | Marks |
| :---: | :---: | :---: | :---: |
| Unit I | Solid State | 8 | 23 |
| Unit II | Solutions | 8 |  |
| Unit III | Electrochemistry | 7 |  |
| Unit IV | Chemical Kinetics | 5 |  |
| Unit V | Surface Chemistry | 5 |  |
| Unit VII | p-Block Elements | 7 | 19 |
| Unit VIII | d -and f-Block Elements | 7 |  |
| Unit IX | Coordination Compounds | 8 |  |
| Unit X | Haloalkanes and Haloarenes | 9 |  |
| Unit XI | Alcohols, Phenols and Ethers | 9 | 28 |
| Unit XII | Aldehydes, Ketones and Carboxylic Acids | 10 |  |
| Unit XIII | Amines | 7 |  |
| Unit XIV | Biomolecules | 8 |  |
|  | Total | 98 | 70 |

## Unit I: Solid State

8 Periods
Classification of solids based on different binding forces: molecular, ionic, covalent and metallic solids, amorphous and crystalline solids (elementary idea). Unit cell in two dimensional and three dimensional lattices, calculation of density of unit cell, packing in solids, packing efficiency, voids, number of atoms per unit cell in a cubic unit cell, point defects.

## Unit II: Solutions

8 Periods
Types of solutions, expression of concentration of solutions of solids in liquids, solubility of gases in liquids, solid solutions, Raoult's law, colligative properties - relative lowering of vapour pressure, elevation of boiling point, depression of freezing point, osmotic pressure, determination of molecular masses using colligative properties.
Unit III: Electrochemistry
Redox reactions, EMF of a cell, standard electrode potential, Nernst equation and its application to chemical cells, Relation between Gibbs energy change and EMF of a cell, conductance in electrolytic solutions, specific and molar conductivity, variations of conductivity with concentration, Kohlrausch's Law, electrolysis.

## Unit IV: Chemical Kinetics

## 5 Periods

Rate of a reaction (Average and instantaneous), factors affecting rate of reaction: concentration, temperature, catalyst; order and molecularity of a reaction, rate law and specific rate constant, integrated rate equations and halflife (only for zero and first order reactions).

## Unit V: Surface Chemistry

5 Periods
Adsorption - physisorption and chemisorption, factors affecting adsorption of gases on solids, colloidal state: distinction between true solutions, colloids and suspension; lyophilic, lyophobic, multi-molecular and macromolecular colloids; properties of colloids; Tyndall effect, Brownian movement, electrophoresis, coagulation.

## Unit VII: p-Block Elements

7 Periods
Group -15 Elements : General introduction, electronic configuration, occurrence, oxidation states, trends in physical and chemical properties; Nitrogen preparation properties and uses; compounds of Nitrogen: preparation and properties of Ammonia and Nitric Acid.
Group 16 Elements : General introduction, electronic configuration, oxidation states, occurrence, trends in physical and chemical properties, dioxygen: preparation, properties and uses, classification of Oxides, Ozone, Sulphur -allotropic forms; compounds of Sulphur: preparation properties and uses of Sulphur-dioxide, Sulphuric Acid: properties and uses; Oxoacids of Sulphur (Structures only).
Group 17 Elements : General introduction, electronic configuration, oxidation states, occurrence, trends in physical and chemical properties; compounds of halogens, Preparation, properties and uses of Chlorine and Hydrochloric acid, interhalogen compounds, Oxoacids of halogens (structures only).
Group 18 Elements: General introduction, electronic configuration, occurrence, trends in physical and chemical properties, uses.

## Unit VIII : d and f Block Elements

7 Periods
General introduction, electronic configuration, occurrence and characteristics of transition metals, general trends in properties of the first row transition metals - metallic character, ionization enthalpy, oxidation states, ionic radii, colour, catalytic property, magnetic properties, interstitial compounds, alloy formation.
Lanthanoids - Electronic configuration, oxidation states and lanthanoid contraction and its consequences.
Unit IX: Coordination Compounds
8 Periods
Coordination compounds - Introduction, ligands, coordination number, colour, magnetic properties and shapes, IUPAC nomenclature of mononuclear coordination compounds. Bonding, Werner's theory, VBT, and CFT.
Unit X: Haloalkanes and Haloarenes.
9 Periods
Haloalkanes : Nomenclature, nature of C-X bond, physical and chemical properties, optical rotation mechanism of substitution reactions.
Haloarenes : Nature of C-X bond, substitution reactions (Directive influence of halogen in monosubstituted compounds only).
Unit XI: Alcohols, Phenols and Ethers
9 Periods
Alcohols : Nomenclature, methods of preparation, physical and chemical properties (of primary alcohols only), identification of primary, secondary and tertiary alcohols, mechanism of dehydration.
Phenols : Nomenclature, methods of preparation, physical and chemical properties, acidic nature of phenol, electrophillic substitution reactions, uses of phenols.
Ethers : Nomenclature, methods of preparation, physical and chemical properties, uses.
Unit XII : Aldehydes, Ketones and Carboxylic Acids
10 Periods
Aldehydes and Ketones : Nomenclature, nature of carbonyl group, methods of preparation, physical and chemical properties, mechanism of nucleophilic addition, reactivity of alpha hydrogen in aldehydes, uses.
Carboxylic Acids : Nomenclature, acidic nature, methods of preparation, physical and chemical properties; uses.
Unit XIII : Amines
7 Periods
Amines : Nomenclature, classification, structure, methods of preparation, physical and chemical properties, uses, identification of primary, secondary and tertiary amines.
Unit XIV : Biomolecules
8 Periods
Carbohydrates - Classification (aldoses and ketoses), monosaccahrides (glucose and fructose), D-L configuration
Proteins -Elementary idea of - amino acids, peptide bond, polypeptides, proteins, structure of proteins - primary, secondary, tertiary structure and quaternary structures (qualitative idea only), denaturation of proteins.
Nucleic Acids: DNA and RNA.

C.B.S.E. Sample Question Paper 2021 (Solved) 1-17

Sample Question Paper (Solved) - 1 18-30
Sample Question Paper (Solved) - 2 31-42
Sample Question Paper (Solved) - 3 43-56
Sample Question Paper (Solved) - $4 \quad$ 57-71
Sample Question Paper (Solved) - 5 72-87

## (Issued by CBSE)

CHEMISTRY - THEORY (043)
M.M. : 70

Time : 3 Hours
General Instructions. Read the following instructions carefully.
(a) There are 33 questions in this question paper. All questions are compulsory.
(b) Section A: Q. Nos. 1 and 2 are case-based questions having four MCQs or Reason Assertion type based on given passage each carrying 1 mark.
(c) Section A: Questions 3 to 16 are MCQs and Reason/Assertion type questions carrying 1 mark each.
(d) Section B: Q. Nos. 17 to 25 are short answer questions and carry 2 marks each.
(e) Section C: Q. Nos. 26 to 30 are short answer questions and carry 3 marks each.
(f) Section D: Q. Nos. 31 to 33 are long answer questions carrying 5 marks each.
(g) There is no overall choice. However, internal choices have been provided
(h) Use of calculators and log tables is not permitted.

## SECTION - A (Objective Type)

1. Read the passage given below and answer the following questions:

An efficient, aerobic catalytic system for the transformation of alcohols into carbonyl compounds under mild conditions, copper-based catalyst has been discovered. This copper-based catalytic system utilizes oxygen or air as the ultimate, stoichiometric oxidant, producing water as the only by-product.

A wide range of primary, secondary, allylic and benzylic alcohols can be smoothly oxidised to the corresponding aldehydes or ketones in good to excellent yields. Air can be conveniently used instead of oxygen without affecting the efficiency of the process. However, the use of air requires slightly longer reaction times.
This process is not only economically viable and applicable to large-scale reactions, but it is also environment friendly.
The following questions are multiple choice questions, choose the most appropriate annswer :
(i) The copper based catalyst mentioned in the study above, can be used to convert :
(a) propanol to propanoic acid
(b) propanone to propanoic acid
(c) propanone to propan-2-ol
(d) propan-2-ol to propanone.
(ii) The carbonyl compound formed when ethanol gets oxidised using this copper-based catalyst can also be obtained by ozonolysis of :
(a) But-1-ene
(b) But-2-ene
(c) Ethene
(d) Pent-1-ene

Which of the following is a secondary allylic alcohol?
(a) But-3-en-2 ol
(b) But-2-en-2-ol
(c) Prop-2-enol
(d) Butan-2-ol
(iii) Benzyl alcohol on treatment with this copper-based catalyst gives a compound ' $\mathbf{A}$ ' which on reaction with KOH gives compounds ' $\mathbf{B}$ ' and ' $\mathbf{C}$ '. Compound ' $\mathbf{B}$ ' on oxidation with $\mathrm{KMnO}_{4}$ gives compound ' $\mathbf{C}$ '. Compounds ' $\mathbf{A}$ ', ' $\mathbf{B}$ ' and ' $\mathbf{C}$ ' respectively are :
(a) Benzaldehyde, Benzyl alcohol, potassium salt of benzoic acid
(b) Benzaldehyde, potassium salt of Benzoic acid, benzyl alcohol
(c) Benzaldehyde, Benzoic acid, Benzyl alcohol
(d) Benzoic acid, Benzyl alcohol, Benzaldehyde.
(iv) An organic compound ' $\mathbf{X}$ ' with molecular formula $\mathrm{C}_{3} \mathrm{H}_{8} \mathrm{O}$ on reaction with this copper based catalyst gives compound ' $\mathbf{Y}$ ' which reduces Tollen's reagent. ' $\mathbf{X}$ ' on reaction with sodium metal gives ' $\mathbf{Z}$ '. What is the product of reaction of ' $\mathbf{Z}$ ' with 2-chloro-2-methylpropane ?
(a) $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OC}\left(\mathrm{CH}_{3}\right)_{3}$
(b) $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OC}\left(\mathrm{CH}_{3}\right)_{3}$
(c) $\mathrm{CH}_{2}=\mathrm{C}\left(\mathrm{CH}_{3}\right)_{2}$
(d) $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}=\mathrm{C}\left(\mathrm{CH}_{3}\right)_{2}$.
2. Read the passage given below and answer the following questions :
$(1 \times 4=4)$
The amount of moisture that leather adsorbs or loses is determined by temperature, relative humidity, degree of porosity, and the size of the pores. Moisture has great practical significance because its amount affects the durability of leather, and in articles such as shoes, gloves, and other garments, the comfort of the wearer. High moisture content accelerates deterioration and promotes mildew action. On the other hand, a minimum amount of moisture is required to keep leather properly lubricated and thus prevent cracking.
The study indicates that adsorption of moisture by leather is a multi-molecular process and is accompanied by low enthalpies of adsorption. Further at 75-percent relative humidity the extent of adsorption is a function of surface area alone. Untanned hide and chrome-tanned leathers have the largest surface areas. The leathers tanned with the vegetable tanning materials have smaller surface areas since they are composed of less hide substance and the capillaries are reduced to smaller diameters, in some cases probably completely filled by tanning materials. This process of tanning occurs due to mutual coagulation of positively charged hide with negatively charged tanning material. The result of the study indicated that untanned hide and chrome-tanned leather adsorb the most water vapour.
In these questions [Q.Nos. (i)-(iv)], a statement of assertion followed by a statement of reason is given. Choose the correct answer out of the following choices.
(a) Assertion and reason both are correct statements and reason is correct explanation for assertion.
(b) Assertion and reason both are correct statements but reason is not correct explanation for assertion.
(c) Assertion is correct statement but reason is wrong statement.
(d) Assertion is wrong statement but reason is correct statement.
(i) Assertion : Vegetable tanned leather cannot adsorb a large amount of moisture.

Reason : Porous materials have higher surface area.
(ii) Assertion : Animal hide soaked in tannin results in hardening of leather.

Reason : Tanning occurs due to mutual coagulation.
(iii) Assertion : Adsorption of moisture by leather is physisorption.

Reason : It is a multimolecular process and is accompanied by low enthalpies of adsorption.
(iv) Assertion : The vegetable tanning materials have smaller surface areas.

Reason : The capillaries present in leather are reduced to smaller diameters.
Or
Assertion : Leather adsorbs different amount of moisture.
Reason : Some moisture is necessary to prevent cracking of leather.
Following questions (Nos. 3-11) are multiple choice questions carrying 1 mark each :
3. Which of the following options will be the limiting molar conductivity of $\mathrm{CH}_{3} \mathrm{COOH}$ if the limiting molar conductivity of $\mathrm{CH}_{3} \mathrm{COONa}$ is $91.0 \mathrm{~S} \mathrm{~cm}^{2} \mathrm{~mol}^{-1}$ ? Limiting molar conductivities for individual ions are given in the following table.

| S.No. | Ions | Limiting molar conductivity $\left.\mathbf{( S ~ c m}^{\mathbf{2}} \mathbf{~ m o l}^{\mathbf{- 1}}\right)$ |
| :---: | :---: | :---: |
| 1. | $\mathrm{H}^{+}$ | $349 \cdot 6$ |
| 2. | $\mathrm{Na}^{+}$ | $50 \cdot 1$ |
| 3. | $\mathrm{~K}^{+}$ | $73 \cdot 5$ |
| 4. | $\mathrm{OH}^{-}$ | $199 \cdot 1$ |

(a) $350 \mathrm{~S} \mathrm{~cm}^{2} \mathrm{~mol}^{-1}$
(b) $375 \cdot 3 \mathrm{~S} \mathrm{~cm}^{2} \mathrm{~mol}^{-1}$
(c) $390.5 \mathrm{~S} \mathrm{~cm}^{2} \mathrm{~mol}^{-1}$
(d) $340.4 \mathrm{~S} \mathrm{~cm}^{2} \mathrm{~mol}^{-1}$.
4. Curdling of milk is an example of :
(a) breaking of peptide linkage
(b) hydrolysis of lactose
(c) breaking of protein into amino acids
(d) denaturation of proetin.
Or

Dissacharides that are reducing in nature are :
(a) sucrose and lactose
(b) sucrose and maltose
(c) lactose and maltose
(d) sucrose, lactose and maltose
5. When 1 mole of benzene is mixed with 1 mole of toluene, the vapour will contain :
(Given : vapour pressure of benzene $=12.8 \mathrm{kPa}$ and vapour pressure of toluene $=3.85 \mathrm{kPa}$ ).
(a) equal amount of benzene and toluene as it forms an ideal solution
(b) unequal amount of benzene and toluene as it forms a non ideal solution
(c) higher percentage of benzene
(d) higher percentage of toluene.
6. Which of the following is the reason for zinc not exhibiting variable oxidation state ?
(a) inert pair effect
(b) completely filled $3 d$-subshell
(c) completely filled $4 s$-subshell
(d) common ion effect.

Or
Which of the following is a diamagnetic ion : (Atomic numbers of $\mathrm{Sc}, \mathrm{V}, \mathrm{Mn}$ and Cu are $21,23,25$ and 29 respectively)
(a) $\mathrm{V}^{2+}$
(b) $\mathrm{Sc}^{3+}$
(c) $\mathrm{Cu}^{2+}$
(d) $\mathrm{Mn}^{3+}$.
7. Propanamide on reaction with bromine in aqueous NaOH gives :
(a) Propanamine
(b) Ethanamine
(c) N-Methylethanamine
(d) Propanenitrile
Or

IUPAC name of product formed by reaction of methylamine with two moles of ethyl chloride
(a) N, N-Dimethylethanamine
(b) N, N-Diethylmethanamine
(c) N -Methyl ethanamine
(d) N-Ethyl-N-methylethanamine
8. Ambidentate ligands $\mathrm{NO}_{2}^{+}$and $\mathrm{SCN}^{-}$are :
(a) unidentate
(b) didentate
(c) polydentate
(d) has variable denticity.
Or

The formula of the coordination compound tetraammineaquachloridocobalt(III) chloride is
(a) $\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{4}\left(\mathrm{H}_{2} \mathrm{O}\right) \mathrm{Cl}\right] \mathrm{Cl}_{2}$
(b) $\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{4}\left(\mathrm{H}_{2} \mathrm{O}\right) \mathrm{Cl}\right] \mathrm{Cl}_{3}$
(c) $\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right) \mathrm{Cl}\right] \mathrm{Cl}_{2}$
(d) $\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{4}\left(\mathrm{H}_{2} \mathrm{O}\right) \mathrm{Cl}\right] \mathrm{Cl}$.
9. Which set of ions exhibit specific colours ? (Atomic number of $\mathrm{Sc}=21, \mathrm{Ti}=22, \mathrm{~V}=23, \mathrm{Mn}=25, \mathrm{Fe}=26$, $\mathrm{Ni}=28, \mathrm{Cu}=29$ and $\mathrm{Zn}=30$ )
(a) $\mathrm{Sc}^{3+}, \mathrm{Ti}^{4+}, \mathrm{Mn}^{3+}$
(b) $\mathrm{Sc}^{3+}, \mathrm{Zn}^{2+}, \mathrm{Ni}^{2+}$
(c) $\mathrm{V}^{3+}, \mathrm{V}^{2+}, \mathrm{Fe}^{3+}$
(d) $\mathrm{Ti}^{3+}, \mathrm{Ti}^{4+}, \mathrm{Ni}^{2+}$.
10. Indentify $\mathbf{A}, \mathbf{B}, \mathbf{C}$ and $\mathbf{D}$ :
(a) $\mathbf{A}=\mathrm{C}_{2} \mathrm{H}_{4}, \mathbf{B}=\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}, \mathbf{C}=\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NC}, \mathbf{D}=\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{CN}$
(b) $\mathbf{A}=\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}, \mathbf{B}=\mathrm{C}_{2} \mathrm{H}_{4}, \mathbf{C}=\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{CN}, \mathbf{D}=\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NC}$
(c) $\mathbf{A}=\mathrm{C}_{2} \mathrm{H}_{4}, \mathbf{B}=\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}, \mathbf{C}=\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{CN}, \mathbf{D}=\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NC}$
(d) $\mathbf{A}=\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}, \mathbf{B}=\mathrm{C}_{2} \mathrm{H}_{4}, \mathbf{C}=\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NC}, \mathbf{D}=\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{CN}$.
11. The crystal showing Frenkel defect is :
(a)

(b)

(c)

(d)

In the following questions (Q.No. 12-16), a statement of assertion followed by a statement of reason is given. Choose the correct answer out of the following choices.
(a) Assertion and reason both are correct statements and reason is correct explanation for assertion.
(b) Assertion and reason both are correct statements but reason is not correct explanation for assertion.
(c) Assertion is correct statement but reason is wrong statement
(d) Assertion is wrong statement but reason is correct statement.
12. Assertion : The two strands are complementary to each other.

Reason : The hydrogen bonds are formed between specific pairs of bases.
13. Assertion : Ozone is thermodynamically stable with respect to oxygen.

Reason : Decomposition of ozone into oxygen results in the liberation of heat.
14. Assertion : Aquatic species are more comfortable in cold waters rather than in warm waters.

Reason : Different gases have different $K_{H}$ values at the same temperature.
Or
Assertion : Nitric acid and water form maximum boiling azeotrope.
Reason : Azeotropes are binary mixtures having the same composition in liquid and vapour phase.
15. Assertion : Carboxylic acids are more acidic than phenols.

Reason : Phenols are ortho and para directing.
16. Assertion : Methoxyethene reacts with HI to give ethanol and iodomethane.

Reason : Reaction of ether with HI follows $\mathrm{S}_{\mathrm{N}^{2}}$ mechanism.

## SECTION - B

The following questions, Q.Nos. 17-25 are short answer type I and carry 2 marks each.
17. Which the help of resonating structures explain the effect of presence of nitro group at ortho position in chlorobenzene.

Or
Carry out the following conversions in not more than 2 steps :
(i) Aniline to chlorobenzene
(ii) 2-Bromopropane to 1-bromopropane.
18. A glucose solution which boils at $101 \cdot 04^{\circ} \mathrm{C}$ at 1 atm . What will be relative lowering of vapour pressure of an aqueous solution of urea which is equimolal to given glucose solution? (Given : $\mathrm{K}_{b}$ for water is $0.52 \mathrm{~K} \mathrm{~kg} \mathrm{~mol}^{-1}$ ).
19. (i) Write the electronic configuration of iron ion in the following complex ion and predict its magnetic behaviour :

$$
\left[\mathrm{Fe}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{2+}
$$

(ii) Write the IUPAC name of the coordination complex : $\left[\mathrm{CoCl}_{2}(\mathrm{en})_{2}\right] \mathrm{NO}_{3}$.

Or
(i) Predict the geometry of $\left[\mathrm{Ni}(\mathrm{CN})_{4}\right]^{2-}$.
(ii) Calculate the spin only magnetic moment of $\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}$ ion.
20. For a reaction the rate law expression is represented as follows :

$$
\text { Rate }=k[\mathbf{A}][\mathbf{B}]^{1 / 2}
$$

(i) Interpret whether the reaction is elementary or complex. Give reason to support your answer.
(ii) Write the units of rate constant for this reaction if concentration of $\mathbf{A}$ and $\mathbf{B}$ is expressed in moles/L.

## Or

The following results have been obtained during the kinetic studies of the reaction :

$$
\mathbf{P}+2 \mathbf{Q} \rightarrow \mathbf{R}+2 \mathbf{S}
$$

| Exp. | Initial P(mol/L) | Initial Q(mol/L) | Init. Rate of Formation of $\mathbf{R}\left(\mathbf{M ~ m i n}^{\mathbf{- 1}}\right)$ |
| :---: | :---: | :---: | :---: |
| 1. | $0 \cdot 10$ | 0.10 | $3.0 \times 10^{-4}$ |
| 2. | 0.30 | 0.30 | $9.0 \times 10^{-4}$ |
| 3. | $0 \cdot 10$ | 0.30 | $3.0 \times 10^{-4}$ |
| 4. | 0.20 | 0.40 | $6.0 \times 10^{-4}$ |

Determine the rate law expression for the reaction.
21. The C-14 content of an ancient piece of wood was found to have three tenths of that in living trees. How old is that piece of wood ? $(\log 3=0 \cdot 4771, \log 7=0 \cdot 8540$, Half-life of $\mathrm{C}-14=5730$ years $)$.
22. When 3-methylbutan-2-ol is treated with HBr , the following reaction takes place :

Give a mechanism for this reaction.
23. Give the formula and describe the structure of a noble gas species which is isostructural with $\mathrm{IF}_{6}^{-}$.
24. The following haloalkanes are hydrolysed in presence of $a q \mathrm{KOH}$.
(i) 1-Chlorobutane
(ii) 2-Chloro-2-methylpropane.

Which of the above is most likely to give $(a)$ an inverted product $(b)$ a racemic mixture ? Justify your answer.
25. Atoms of element $P$ form $c c p$ lattice those of the element $Q$ occupy $1 / 3$ rd of tetrahedral voids and all octahedral voids. What is the formula of the compound formed by the elements P and Q ?

## SECTION - C

Q. Nos. 26-30 are Short Answer Type II carrying 3 mark each.
26. Give reasons for the following :
(i) Transition elements act as catalysts
(ii) It is difficult to obtain oxidation state greater than two for copper
(iii) CrO is basic but $\mathrm{Cr}_{2} \mathrm{O}_{3}$ is amphoteric.

Or
Observed and calculated values for the standard electrode potentials of elements from Ti to Zn in the first transition series are depicted in Fig. 1.

Fig. 1
Explain the following observations :
(i) The general trend towards less negative $\mathrm{E}^{\mathrm{o}}$ values across the series
(ii) The unique behaviour of copper
(iii) More negative $\mathrm{E}^{\mathrm{o}}$ values of Mn and Zn .
27. Arrange the following in increasing order of property specified :
(i) Aniline, ethanamine, N -ethylethanamine (solubility in water)
(ii) Ethanoic acid, ethanamine, ethanol (boiling point)
(iii) Methanamine, $\mathrm{N}, \mathrm{N}$ dimethylmethanamine and N -methylmethanamine (basic strength in aqueous phase).

Or
(i) Give a chemical test to distinguish between N -methylethanamine and $\mathrm{N}, \mathrm{N}$-dimethyl ethanamine.
(ii) Write the reaction for catalytic reduction of nitrobenzene followed by reaction of product so formed with bromine water.
(iii) Out of butan-1-ol and butan-1-amine, which will be more soluble in water and why ?
28. A metal crystallizes into two cubic system-face centred cubic ( $f c c$ ) and body centred cubic ( $b c c$ ) whose unit cell lengths are 3.5 and $3.0 \AA$ respectively. Calculate the ratio densities of $f c c$ and $b c c$.
29. Three amino acids are given below :

Alanine : $\mathrm{CH}_{3} \mathrm{CH}(\mathrm{COCH})\left(\mathrm{NH}_{2}\right)$, Aspartic acid : $\mathrm{HOOC}-\mathrm{CH}_{2} \mathrm{CH}(\mathrm{COOH})\left(\mathrm{NH}_{2}\right)$ and Lysine : $\mathrm{H}_{2} \mathrm{~N}-\left(\mathrm{CH}_{2}\right)_{4}-\mathrm{CH}(\mathrm{COOH})\left(\mathrm{NH}_{2}\right)$.
(i) Make two tripeptides using these amino acids and mark the peptide linkage in both cases.
(ii) Represent alanine in the zwitter ionic form.
30. (i) Arrange the following in decreasing order of bond dissociation enthalpy

$$
\mathrm{F}_{2}, \mathrm{Cl}_{2}, \mathrm{Br}_{2}, \mathrm{I}_{2}
$$

(ii) Bi does not form $p \pi-p \pi$ bonds. Give reason for the observation.
(iii) Electron gain enthalpy of oxygen is less negative than sulphur. Justify.

## SECTION - D

Q. Nos. 31 to 33 are long answer type carrying 5 marks each.
31. (i) Answer the following questions:
(a) Write the balanced chamical reaction for reaction of Cu with dilute $\mathrm{HNO}_{3}$.
(b) Draw the shape of $\mathrm{CIF}_{3}$.
(ii) ' X ' has a boiling point of $4 \cdot 2 \mathrm{~K}$, lowest for any known substance. It is used as a diluent for oxygen in modern diving apparatus. Identify the gas ' X '. Which property of this gas makes it usable as diluent? Why is the boiling point of the gas ' X ' so low?

## Or

(i) Answer the following questions :
(a) Arrange the following in the increasing order of thermal stability :

$$
\mathrm{H}_{2} \mathrm{O}, \mathrm{H}_{2} \mathrm{~S}, \mathrm{H}_{2} \mathrm{Se}, \mathrm{H}_{2} \mathrm{Te}
$$

(b) Give the formula of the brown ring formed at the interface during the ring test for nitrate.
(ii) A greenish yellow gas ' A ' with pungent and suffocating odour, is a powerful bleaching agent. ' A ' on treatment with dry slaked lime it gives bleaching power. Identify ' $A$ ' and explain the reason for its bleaching action. Write the balanced chemical equation for the reaction of ' A ' with hot concentrated NaOH .
32. An organic compound ' $A$ ' $\mathrm{C}_{8} \mathrm{H}_{6}$ on treatment with dilute $\mathrm{H}_{2} \mathrm{SO}_{4}$ containing mercuric sulphate gives compound ' B '. This compound ' B ' can also be obtained from a reaction of benzene with acetyl chloride in presence of anhy. $\mathrm{AlCl}_{3}$. ' B ' on treatment with $\mathrm{I}_{2}$ in $a q$. KOH gives ' C ' and a yellow compound ' D '. Identify $\mathrm{A}, \mathrm{B}, \mathrm{C}$ and D . Give the chemical reactions involved.

Or
(i) Write the reaction for cross aldol condensation of acetone and ethanal.
(ii) How will you carry out the following conversions :
(a) Benzyl alcohol to phenyl ethanoic acid
(b) Propanone to propene
(c) Benzene to $m$-Nitroacetophenone.
33. (i) State Kohlrausch law.
(ii) Calculate the emf of the following cell at 298 K :

$$
\mathrm{Al}(s)\left|\mathrm{Al}^{3+}(0 \cdot 15 \mathrm{M})\right|\left|\mathrm{Cu}^{2+}(0 \cdot 025 \mathrm{M})\right| \mathrm{Cu}(s)
$$

$\left(\right.$ Given $\mathrm{E}^{\mathrm{o}}\left(\mathrm{Al}^{3+} / \mathrm{Al}\right)=-1 \cdot 66 \mathrm{~V}, \mathrm{E}^{\mathrm{o}}\left(\mathrm{Cu}^{2+} / \mathrm{Cu}\right)=0.34 \mathrm{~V}, \log 0 \cdot 15=-0 \cdot 8239, \log 0 \cdot 025=-1.6020$
(i) On the basis of $\mathrm{E}^{\mathrm{o}}$ values identify which amongst the following is the strongest oxidising agent

$$
\begin{array}{cl}
\mathrm{Cl}_{2}(g)+2 e^{-} \rightarrow 2 \mathrm{Cl}^{-} ; & \mathrm{E}^{\mathrm{o}}=+1.36 \mathrm{~V} \\
\mathrm{MnO}_{4}^{-}+8 \mathrm{H}^{+}+5 e^{-} \rightarrow \mathrm{Mn}^{2+}+4 \mathrm{H}_{2} \mathrm{O} ; & \mathrm{E}^{\mathrm{o}}=+1.51 \mathrm{~V} \\
\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}+14 \mathrm{H}^{+}+6 e^{-} \rightarrow 2 \mathrm{Cr}^{3+}+7 \mathrm{H}_{2} \mathrm{O} ; & \mathrm{E}^{\mathrm{o}}=+1.33 \mathrm{~V}
\end{array}
$$

(ii) The following Fig. 2, represents variation of $\left(\Lambda_{m}\right)$ vs $\sqrt{\mathrm{C}}$ for an electrolyte. Here $\Lambda_{m}$ is the molar conductivity and C is the concentration of the electrolyte.

Fig. 2
(a) Define molar conductivity.
(b) Identify the nature of electrolyte on the basis of the above plot. Justify your answer.
(c) Determine the value of $\Lambda_{m}^{0}$ for the electrolyte.
(d) Show how to calculate the value of A for the electrolyte using the above graph.

## SOLUTION

1. (i) (d) Explanation : Propan-2-ol is a $2^{\circ}$ alcohol. The given copper based catalyst will oxidise it to corresponding ketone i.e., propanone.
(ii) (b) Explanation :

Phen : Phenanthroline
$\mathrm{DBADH}_{2}$ : Di-terbutyl azo dicarboxylate (Di-terbutyl hydrazine-1, 2-dicarboxylate)

Or
(a) Explanation : Formula of sec-allylic alcohol :

But-3-en-2-ol
(iii) (a) Explanation : $\underset{\substack{\text { Benzyl acohol }}}{2 \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CH}_{2} \mathrm{OH}}+\mathrm{O}_{2} \xrightarrow{\mathrm{Cu} \text {-based catalyst }} \underset{\substack{\text { Benzaldehyde (A) }}}{2 \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CHO}}+2 \mathrm{H}_{2} \mathrm{O}$

Benzyl acohol (A) Pot benzoate (C)

A : Benzaldehyde
B : Benzyl alcohol
C : Pot. benzoate (potassium salt of benzoic acid)
(iv) (c) Explanation : $\mathbf{X}\left(\mathrm{C}_{3} \mathrm{H}_{8} \mathrm{O}\right)$ can be propyl alcohol or isopropyl alcohol. Oxidation of $\mathbf{X}$ with air and copper based catalyst gives $\mathbf{Y}$. As $\mathbf{Y}$ reduces Tollen's reagent, it is an aldehyde, therefore $\mathbf{X}$ is a $1^{\circ}$ alcohol, i.e., propyl alcohol $\left(\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}\right)$.

$$
\underset{\text { Propyl alcohol (X) }}{2 \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}}+2 \mathrm{Na} \longrightarrow \underset{\text { Sod propanoixde }(\mathbf{Z})}{2 \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{ONa}}+\mathrm{H}_{2}
$$

As 2-chloro-2-methylpropane is a $3^{\circ}$ alkyl halide, its reaction with $\mathbf{Z}$ leads to elimination reaction.

2. (i) (b) Correct explanation : Vegetable tanned leather has smaller surface area due to blockage of capillaries by tanning materials.
(ii) (a) Reason is the correct explanation of assertion.
(iii) (a) Reason is the correct explanation of assertion.
(iv) (a) Reason in the correct explanation of assertion.
(iv) (b) Correct explanation : The amount of water adsorbed by leather depends upon the nature of tanning.
3. (c) Explanation :

$$
\begin{aligned}
\Lambda_{m}^{\mathrm{o}}\left(\mathrm{CH}_{3} \mathrm{COOH}\right) & =\Lambda_{m}^{\mathrm{o}}\left(\mathrm{CH}_{3} \mathrm{COONa}\right)+\Lambda_{m}^{\mathrm{o}}\left(\mathrm{H}^{+}\right)-\Lambda_{m}^{\mathrm{o}}\left(\mathrm{Na}^{+}\right) \\
& =(91+349 \cdot 6-50 \cdot 1) \mathrm{S} \mathrm{~cm}^{2} \mathrm{~mol}^{-1} \\
& =(440 \cdot 6-50 \cdot 1) \mathrm{S} \mathrm{~cm} \\
& =\mathbf{3 9 0} \mathrm{mol}^{-1} \\
& \mathbf{S ~ c m} \mathbf{~ m o l}^{-1}
\end{aligned}
$$

4. (d) Explanation : Curdling of milk is an example of denauration of protein.

## Or

(c) Explanation : Sucrose is a non-reducing sugar.
5. (c) Explanation :

$$
\begin{aligned}
n_{\mathrm{T}} & =1 \mathrm{~mol}, n_{\mathrm{B}}=1 \mathrm{~mol} \\
x_{\mathrm{T}} & =\frac{n_{\mathrm{T}}}{n_{\mathrm{T}}+n_{\mathrm{B}}}=\frac{1}{1+1}=\frac{1}{2}=0.5 \\
x_{\mathrm{B}} & =1-0.5=0.5 \\
p_{\mathrm{T}} & =p_{\mathrm{T}}^{\mathrm{o}} \times x_{\mathrm{T}}=3.85 \mathrm{kPa} \times 0.5 \\
& =1.925 \mathrm{kPa} \\
p_{\mathrm{B}} & =p_{\mathrm{B}}^{\mathrm{o}} \times x_{\mathrm{B}}=12.8 \mathrm{kPa} \times 0.5 \\
& =6.4 \mathrm{kPa}
\end{aligned}
$$

Mole fraction of toluene in vapour,

$$
\begin{aligned}
y_{\mathrm{T}} & =\frac{p_{\mathrm{T}}}{p_{\mathrm{T}}+p_{\mathrm{B}}}=\frac{1 \cdot 925}{1 \cdot 925+6 \cdot 4}=\frac{1 \cdot 925}{8 \cdot 325} \\
& =\mathbf{0 . 2 3}
\end{aligned}
$$

Mole fraction of benzene in vapour phase is,

$$
y_{\mathrm{B}}=1-y_{\mathrm{T}}=1-0.23=\mathbf{0} .77
$$

As mole fraction of benzene in vapour phase is more, the vapour will have a higher percentage of benzene.
6. (b) Explanation : $\operatorname{Zinc}(Z=30)$ does not show variable oxidation state because it has completely filled $3 d$-sub shell.

Or
(b) Explanation : An ion is diamagnetic if it has no unpaired electron. Out of the given four choices, $\mathrm{Sc}^{3+}$ has no unpaired electron as explained below :

$$
\begin{aligned}
& \mathrm{Sc}(\mathrm{Z}=21):[\mathrm{Ar}]^{18} 3 d^{1} 4 s^{2} \\
& \mathrm{Sc}^{3+}:[\mathrm{Ar}]^{18} \text { or } 1 s^{2} 2 s^{2} 2 p^{6} 3 s^{2} 3 p^{6}
\end{aligned}
$$

7. (b) Explanation : Hoffmann bromamide reaction

Propanamide
Or
(d) Explanation :

8. (a) Explanation : Ambidentate ligand has two or more donor atoms, but only one atom can donate a pair of electrons at a time. As such ambidentate ligand is unidentate.
(a) Explanation :
$\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{4}\left(\mathrm{H}_{2} \mathrm{O}\right) \mathrm{Cl}\right] \mathrm{Cl}_{2}$
tetraammineaquachloridocobalt(III) chloride
9. (c) Explanation : Ions with fully filled or empty $(n-1) d$-subshell are colourless.

$$
\begin{aligned}
\mathrm{Sc}(\mathrm{Z}=21) & :[\mathrm{Ar}]^{18} 3 d^{1} 4 s^{2} \\
\mathrm{Sc}^{3+} & :[\mathrm{Ar}]^{18} 3 d^{0} \\
\mathrm{Ti}(\mathrm{Z}=22) & :[\mathrm{Ar}]^{18} 3 d^{2} 4 s^{2} \\
\mathrm{Ti}^{4+} & :[\mathrm{Ar}]^{18} 3 d^{0}
\end{aligned}
$$

10. (a) Explanation :

11. (a) Explanation : Frenkel defect involves dislocation of the smaller ions (generally cation) from its lattice sites to some interstitial site.
12. (a) Reason is the correct explanation of the assertion.
13. (d) Correct assertion : Ozone is thermodynamically unstable with respect to oxygen.
14. (b) Correct explanation : Dissolution of $\mathrm{O}_{2}$ in water increases with decrease in temperature.

## Or

(b) Correct explanation : A mixture of nitric acid and water shows negative deviation from ideal behaviour.
15. (b) Correct explanation : Resonance stabilisation of carboxylate ion is more than that of phenoxide ion.
16. (a) Reason is the correct explanation of the assertion.
17. Nitro group at ortho position withdraws the electron density from the benzene ring and thus facilitates the attack of the nucleophile on haloarene.

(i)

(ii)

18.

$$
\begin{aligned}
\Delta \mathrm{T}_{b} & =\mathrm{T}_{b}-\mathrm{T}_{b}^{\mathrm{o}}=(10.04-100)^{\circ} \mathrm{C}=1.04^{\circ} \mathrm{C}=1.04 \mathrm{~K} \\
\mathrm{~K}_{b}(\text { water }) & =0.52 \mathrm{~K} \mathrm{~kg} \mathrm{~mol} \\
\Delta \mathrm{~T}_{b} & =\mathrm{K}_{b} \times m \\
m & =\frac{\Delta \mathrm{T}_{b}}{\mathrm{~K}_{b}}=\frac{1.04 \mathrm{~K}}{0.52 \mathrm{~K} \mathrm{~kg} \mathrm{~mol}^{-1}}=2 \mathrm{~mol} \mathrm{~kg}^{-1},
\end{aligned}
$$

Hence, the solution contains 2 mol of solute (glucose) in $1 \mathrm{~kg}(1000 \mathrm{~g})$ of water. Given urea solution has same molality as the glucose solution. Hence

No. of moles of urea, $n_{2}=2$
No. of moles of water, $n_{1}=\frac{1000 \mathrm{~g}}{18 \mathrm{~g} \mathrm{~mol}^{-1}}=55.55 \mathrm{~mol}$
Mole fraction of urea, $x_{2}=\frac{n_{2}}{n_{1}+n_{2}}=\frac{2}{2+55 \cdot 55}=\frac{2}{57 \cdot 55}=0.034$.
Relative lowering of V.P. $=x_{2}=\mathbf{0 . 0 3 4}$.
19. (i) O.S. of iron in the complex $\left[\mathrm{Fe}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{2+}=+2$

$$
\begin{gathered}
\mathrm{Fe}(\mathrm{Z}=26):[\mathrm{Ar}]^{18} 3 d^{6} 4 s^{2} \\
\mathrm{Fe}^{2+}:[\mathrm{Ar}]^{18} 3 d^{6}
\end{gathered}
$$

Water is a strong field ligand. Hence, electronic configuration of iron in the complex $\left[\mathrm{Fe}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{2+}$ is $t_{2 g}^{4} e_{g}^{2}$.

Due to the presence of 4 unpaired electrons, the complex is paramagnetic.
(ii) $\left[\mathrm{CoCl}_{2}(e n)_{2}\right] \mathrm{NO}_{3}$

IUPAC name : dichoridobis(ethane-1, 2-diamine)cobalt(III) nitrate
Or
(i) O.S. of nickel in the complex $\left[\mathrm{Ni}(\mathrm{CN})_{4}\right]^{2-}=+2$

$$
\begin{gathered}
\mathrm{Ni}(\mathrm{Z}=28):[\mathrm{Ar}]^{18} 3 d^{8} 4 s^{2} \\
\mathrm{Ni}^{2+}:[\mathrm{Ar}]^{18} 3 d^{8}
\end{gathered}
$$

$\mathrm{CN}^{-}$is a strong field ligand. As such, pairing of electrons will take place in $3 d$-subshell. Hybridisation is $d s p^{2}$ and the shape of the complex is square planar.
(ii) O.S. of copper in the complex $\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}=+2$

$$
\begin{aligned}
\mathrm{Cu}(\mathrm{Z}=29) & :[\mathrm{Ar}]^{18} 3 d^{10} 4 s^{1} \\
\mathrm{Cu}^{+} & :[\mathrm{Ar}]^{18} 3 d^{9}
\end{aligned}
$$

No. of unpaired electrons, $n=1$

$$
\mu_{\text {spin only }}=\sqrt{n(n+2)}=\sqrt{1(1+2)}=\sqrt{3}=\mathbf{1 . 7 3 2} \mathbf{B M}
$$

$$
\text { Rate }=k[\mathrm{~A}][\mathrm{B}]^{1 / 2}
$$

Order of the reaction $=1+\frac{1}{2}=\mathbf{1 . 5}$
As the order of the reaction is a fraction, it is a complex reaction.

$$
\begin{aligned}
k & =\frac{\text { Rate }}{(\text { conc. })^{3 / 2}} \\
\text { Units of } k & =\frac{\mathrm{molL}^{-1} \mathrm{~s}^{-1}}{\left(\mathrm{molL}^{-1}\right)^{3 / 2}}=\operatorname{mol}^{-1 / 2} \mathbf{L}^{\mathbf{1 / 2}} \mathrm{s}^{-\mathbf{1}}
\end{aligned}
$$

Or
Let the rate law expression is ;

$$
\text { Rate }=k[\mathbf{P}]^{a}[\mathbf{Q}]^{b}
$$

From Experiment No. 1

$$
\begin{equation*}
3 \cdot 0 \times 10^{-4}=k(0 \cdot 10)^{a}(0 \cdot 10)^{b} \tag{i}
\end{equation*}
$$

From Experiment No. 2

$$
\begin{equation*}
9 \cdot 0 \times 10^{-4}=k(0 \cdot 30)^{a}(0 \cdot 30)^{b} \tag{ii}
\end{equation*}
$$

From Experiment No. 3

$$
\begin{equation*}
3 \cdot 0 \times 10^{-4}=k(0 \cdot 10)^{a}(0 \cdot 30)^{b} \tag{iii}
\end{equation*}
$$

From Experiment No. 4

$$
\begin{equation*}
6 \cdot 0 \times 10^{-4}=k(0 \cdot 20)^{a}(0 \cdot 40)^{b} \tag{iv}
\end{equation*}
$$

Dividing Eqn. No. (ii) by Eqn. No. (iii),

$$
\begin{aligned}
\frac{9 \cdot 0 \times 10^{-4}}{3 \cdot 0 \times 10^{-4}} & =\frac{k(0 \cdot 30)^{a}(0 \cdot 30)^{b}}{k(0 \cdot 10)^{a}(0 \cdot 30)^{b}} \\
3 & =3^{a} \Rightarrow a=1
\end{aligned}
$$

Dividing Eqn. No. (iv) by Eqn. No. (i),

Hence, rate law expression is :
21.

$$
\begin{aligned}
\frac{6 \cdot 0 \times 10^{-4}}{3 \cdot 0 \times 10^{-4}} & =\frac{k(0 \cdot 20)^{a}(0 \cdot 40)^{b}}{k(0 \cdot 10)^{a}(0 \cdot 10)^{b}} \\
2 & =2^{a} 4^{b} \\
a & =1 \Rightarrow b=0
\end{aligned}
$$

$$
\begin{aligned}
\text { Rate } & =k[\mathbf{P}] \\
t_{1 / 2} & =5730 \text { years } \\
k & =\frac{0.693}{t_{1 / 2}}=\frac{0.693}{5730} \text { year }^{-1}=1.21 \times 10^{-4} \text { year }^{-1}
\end{aligned}
$$

(Radioactive decay follows 1st order kinetics)

$$
\begin{aligned}
{[\mathrm{R}]_{0} } & =1(\text { say }) ;[\mathrm{R}]=\frac{3}{10} \\
t & =\frac{2 \cdot 303}{k} \log \frac{[\mathrm{R}]_{0}}{[\mathrm{R}]} \\
t & =\frac{2 \cdot 303}{1 \cdot 21 \times 10^{-4} \mathrm{year}^{-1}} \log \frac{1}{3 / 10} \\
& =\frac{2 \cdot 030}{1 \cdot 21 \times 10^{-4} \text { year }^{-1}} \log \frac{10}{3}=\frac{2 \cdot 303}{1 \cdot 21 \times 10^{-4}}(\log 10-\log 3) \text { year } \\
& =\frac{2 \cdot 303(1-0.4771)}{1.21 \times 10^{-4}} \text { year }=\frac{2 \cdot 303 \times 0.5229 \times 10^{4}}{1 \cdot 21} \text { year } \\
& =0.99524 \times 10^{4} \text { year }=\mathbf{9 9 5 2 . 4} \text { year. }
\end{aligned}
$$

## 22. Mechanism of the reaction

23. $\mathrm{IF}_{6}^{-}$has six bond pairs and one lone pair. Noble gas species isoelectronic with $\mathrm{IF}_{6}^{-}$is $\mathrm{XeF}_{6}$.

## Structure of $\mathbf{X e F}_{6}$

In $\mathrm{XeF}_{6}$, the central Xe atom has 8 valence electrons. It forms 6 bonds with six F -atoms and has one lone pair. According to VSEPR theory, presence of 6 b.p. and 1 l.p. results in distorted octahedral geometry as shown below :

24.

1-Chlorobuntane
( $1^{\circ}$ alkyl halide)

2-Chloro-2-methylpropane
( $3^{\circ}$ alkyl halide)
(a) Alkyl halides with aq KOH give alcohols. It is a nucleophilic substitution reaction. In this reaction $1^{\circ}$ alkyl halide undergo $\mathrm{S}_{\mathrm{N}^{2}}$ reaction giving inverted product. Thus 1-chlorobutane will give inverted product.
(b) In nucleophilic substitution reaction $3^{0}$ alkyl halide undergoes $\mathrm{S}_{\mathrm{N}^{1}}$ reaction, giving a racemic mixture. Hence 2-chloro-2-methylpropane will give a racemic mixture.
25. Let number of atoms of element P in $c c p$ lattice $=n$

$$
\begin{aligned}
\therefore & \text { Octahedral voids } & =n \\
& \text { Tetrahedral voids } & =2 n
\end{aligned}
$$

Number of atoms of element $\mathrm{Q}=$ No. of octahedral voids $+\frac{1}{3} \times$ No. of tetrahedral voids

$$
=n+\frac{2 n}{3}=\frac{5 n}{3}
$$

$\therefore$ Formula of compound is $\mathrm{P}_{n} \mathrm{Q}_{\frac{5 n}{3}}$ or $\mathbf{P}_{3} \mathrm{Q}_{5}$
26. (i) Transition elements and their compounds act as good catalysts due to the following two reasons :
(a) Ability of transition elements to show variable oxidation states.
(b) Due to the presence of incomplete $d$-subshell in transition elements, they can form unstable intermediates. These intermediates give reaction path of lower activation energy and therefore increase the rate of the reaction.
(ii) It is due to high value of third ionisation enthalpy.
(iii) In CrO , O.S. of Cr is +2 and in $\mathrm{Cr}_{2} \mathrm{O}_{3}$, O.S. of Cr is +3 . As the O.S. of metal in its oxide increases, the basic character of oxide decreases, while its acidic nature increases. Thus CrO is basic while $\mathrm{Cr}_{2} \mathrm{O}_{3}$ is amphoteric (i.e., it shows both acidic as well as basic characters).

Or
(i) The general trend towards less negative $\mathrm{E}^{\mathrm{o}}$ values across the series is due to the general increase in the sum of first and second ionisation enthalpies.
(ii) In $3 d$-series, copper has + ve $\mathrm{E}^{0}$ value. It is due to high energy of transformation of $\mathrm{Cu}(s)$ to $\mathrm{Cu}^{2+}(g)$, which is not balanced by its hydration enthalpy.
(iii) The stability of the half filled $d$-subshell in $\mathrm{Mn}^{2+}$ and completely filled $d^{10}$ configuration in $\mathrm{Zn}^{2+}$ are related to their more negative $\mathrm{E}^{\mathrm{o}}$ values.
27. (i) Increasing order of solubility in water :

Aniline $<\mathrm{N}$-Ethylethanamine $<$ Ethanamine
(Aromatic amines are less soluble than aliphatic amines and solubility of aliphate amines follows the order $3^{\circ}<2^{\circ}<1^{\circ}$ due to H -bonding with water molecules)
(ii) Increasing order of boiling points :

Ethanamine $<$ Ethanol < Ethanoic acid
(Acids have higher boiling points than corresponding alcohols due to dimer formation. H-bonding is stronger in alcohols than amines).
(iii) Increasing basic character in aqueous solution :

N , N-Dimethylethanamine < Methanamine < N-Methylmethanamine
(In aqueous solution, $2^{\circ}$ amine is most basic).

## Or

(i)

$\mathrm{N}, \mathrm{N}$-Dimethylethanamine ( $3^{\circ}$ Amine)

A $2^{\circ}$ amine reacts with benzene sulphonyl chloride as follows. The product formed is insoluble in KOH .

A $3^{\circ}$ amine cannot react with benzene sulphonyl chloride. Thus out of these two amines only N -methylethanamine will react with benzene sulphonyl chloride to give a product insoluble in KOH .
(ii)

(iii) Butan-1-ol is more soluble is water. Alcohol forms stronger H-bonds with water than amines. It is due to higher electronegativity and smaller size of O in alcohol than N in amine.
28. Density,

$$
d=\frac{z \times \mathrm{M}}{\mathrm{~N}_{\mathrm{A}} \times a^{3}}
$$

where
$z=$ No. of atmos per unit cell
$\mathrm{M}=$ Molar mass $\left(\mathrm{g} \mathrm{mol}^{-1}\right)$

$$
\begin{aligned}
\mathrm{N}_{\mathrm{A}} & =\text { Avogadro's Number }\left(6 \cdot 022 \times 10^{23} \mathrm{~mol}^{-1}\right) \\
a & =\text { Edge length of cube }(\mathrm{cm})
\end{aligned}
$$

For f.c.c. structure

$$
\begin{aligned}
z & =4 \\
a & =3.5 \AA=3.5 \times 10^{-8} \mathrm{~cm} \\
\therefore \quad & d
\end{aligned}
$$

For b.c.c. structure

$$
\begin{aligned}
z & =2 \\
a & =3 \cdot 0 \AA=3 \cdot 0 \times 10^{-8} \mathrm{~cm} \\
\therefore \quad d & =\frac{2 \times \mathrm{M}}{\mathrm{~N}_{\mathrm{A}} \times\left(3 \cdot 0 \times 10^{-8}\right)^{3}} \\
\frac{d}{d^{\prime}} & =\frac{4 \times\left(3 \cdot 0 \times 10^{-8}\right)^{3}}{2 \times\left(3 \cdot 5 \times 10^{-8}\right)^{3}}=\frac{4 \times 3 \times 3 \times 3}{2 \times 3 \cdot 5 \times 3 \cdot 5 \times 3 \cdot 5} \\
& \left.=\frac{1 \cdot 26}{1 \cdot 00} \text { (approx. }\right)
\end{aligned}
$$

29. (i) There are 3 different amino acids. Hence, total number of tripeptides with different amino acids $=6$

Out of these 6, two tripeptides can be;
Ala-Asp-Lys and Ala-Lys-Asp

(ii)

30. (i) Decreasing order of bond dissociation enthalpy :

$$
\mathrm{Cl}_{2}>\mathrm{Br}_{2}>\mathrm{F}_{2}>\mathrm{I}_{2}
$$

Bond dissociation enthalpy of $\mathrm{F}_{2}$ is exceptionally low. It is due to strong repulsions between lone pairs on two F-atoms which are very near to each other.
(ii) Bismuth (Bi) does not form $p \pi-p \pi$ bonds as its atomic orbitals are large and diffuse. As such effective overlapping is not possible.
(iii) Due to small size of O , strong interelectronic repulsions take place in the relatively compact $2 p$-subshell and thus incoming electron is less firmly held by the nucleus.
31. (i) (a)

$$
\begin{aligned}
& 2 \mathrm{HNO}_{3}(d i l) \longrightarrow \mathrm{H}_{2} \mathrm{O}+2 \mathrm{NO}+3[\mathrm{O}] \\
& \mathrm{Cu}+2 \mathrm{HNO}_{3}+[\mathrm{O}]\left.\mathrm{Cu}\left(\mathrm{NO}_{3}\right)_{2}+\mathrm{H}_{2} \mathrm{O}\right] \times 3 \\
& \hline 3 \mathrm{Cu}+8 \mathrm{HNO}_{3}(\text { dil }) \longrightarrow 3 \mathrm{Cu}\left(\mathrm{NO}_{3}\right)_{2}+2 \mathrm{NO}+4 \mathrm{H}_{2} \mathrm{O} \\
& \hline
\end{aligned}
$$

(b) $\mathrm{ClF}_{3}$ molecule has 3 bond pairs and 2 lone pairs. As such it is a T-shaped molecule as shown below :

(ii) Gas $\mathbf{X}$ is helium.

Helium is used as a diluent for oxygen in modern diving apparatus because of its very low solubility in blood.
Helium is a monoatomic gas with just 2 electrons. As such the interatomic forces as very weak London dispersion forces, resulting in extremely low boiling point.

## Or

(i) (a) Increasing order of thermal stability

$$
\mathrm{H}_{2} \mathrm{Te}<\mathrm{H}_{2} \mathrm{Se}<\mathrm{H}_{2} \mathrm{~S}<\mathrm{H}_{2} \mathrm{O}
$$

(b) Formula for brown ring in ring test for nitrate : $\left[\mathrm{Fe}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5} \mathrm{NO}\right]^{2+}$.
(ii) Gas $\mathbf{A}$ is chlorine $\left(\mathrm{Cl}_{2}\right)$.
$\mathrm{Cl}_{2}$ acts as a strong bleaching agent due to its oxidising nature. It bleaches coloured organic substance due to oxidation.

$$
\mathrm{Cl}_{2}+\mathrm{H}_{2} \mathrm{O} \longrightarrow 2 \mathrm{HCl}+[\mathrm{O}]
$$

Coloured substance $+[\mathrm{O}] \longrightarrow$ Colourless substance
Reaction of $\mathrm{Cl}_{2}$ with hot conc. NaOH

$$
\begin{aligned}
& \mathrm{Cl}_{2}+\mathrm{H}_{2} \mathrm{O}\longrightarrow \mathrm{HCl}+\mathrm{HOCl}] \times 3 \\
& \mathrm{NaOH}+\mathrm{HCl}\left.\longrightarrow \mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}\right] \times 3 \\
& \mathrm{NaOH}+\mathrm{HOCl}\left.\longrightarrow \mathrm{NaOCl}+\mathrm{H}_{2} \mathrm{O}\right] \times 3 \\
& 3 \mathrm{NaOCl} \longrightarrow 2 \mathrm{NaCl}+\mathrm{NaClO}_{3} \\
& \hline 3 \mathrm{Cl}_{2}+6 \mathrm{NaOH} \longrightarrow 5 \mathrm{NaCl}+\mathrm{NaClO}_{3}+3 \mathrm{H}_{2} \mathrm{O} \\
& \hline
\end{aligned}
$$

32. As $\mathbf{A}$ reacts with dil $\mathrm{H}_{2} \mathrm{SO}_{4}$ in the presence of $\mathrm{HgSO}_{4}, \mathbf{A}$ is an alkyne. Its molecular formula $\left(\mathrm{C}_{8} \mathrm{H}_{6}\right)$ indicates that it has the following structure.

(A)

Reaction of $\mathbf{A}$ with dil $\mathrm{H}_{2} \mathrm{SO}_{4} / \mathrm{HgSO}_{4}$ is;

(B)

Iodoform forms a yellow ppt.

OR
(i) Two different cross-aldol products are possible as shown below :

(ii) (a) Benzyl alcohol to phenylethanoic acid

(b) Propanone to propene

(c) Benzene to $m$-nitroacetophenone

33. (i) Kohlrausch Law : At infinite dilution, when dissociation is complete, each ion makes a definite contribution towards molar conductance of the electrolyte irrespective of the nature of the other ion with which it is associated.
If molar conductivity at infinite dilution of cation is $\lambda^{0}{ }_{+}$and that of anion is $\lambda_{-}^{0}$, then according to Kohlrausch law ;

$$
\lambda_{m}^{0}=x \lambda_{+}^{0}+y \lambda_{-}^{0}
$$

where $x$ and $y$ are number of cations and anions per formula unit of the electrolyte.
(ii) Cell representation is;

$$
\mathrm{Al}(s)\left|\mathrm{Al}^{3+}(0 \cdot 15 \mathrm{M})\right|\left|\mathrm{Cu}^{2+}(0 \cdot 025 \mathrm{M})\right| \mathrm{Cu}(s)
$$

Half cell reactions

$$
\begin{aligned}
& \mathrm{Al}(s)\left.\longrightarrow \mathrm{Al}^{3+}+3 e^{-}\right] \times 2 \\
& \mathrm{Cu}^{2+}+2 e^{-}\longrightarrow \mathrm{Cu}(s)] \times 3 \\
& \hline 2 \mathrm{Al}(s)+3 \mathrm{Cu}^{2+} \longrightarrow \mathrm{Al}^{3+}+3 \mathrm{Cu}(s) \\
& \hline
\end{aligned}
$$

Here $n$ (no. of electrons) $=6$

$$
\begin{aligned}
\mathrm{E}_{\text {cell }}^{0} & =\mathrm{E}_{\mathrm{Cu}^{2+} / \mathrm{Cu}^{-}}^{0}-\mathrm{E}_{\mathrm{Al}^{3+} / \mathrm{Al}}^{0} \\
& =[0 \cdot 34-(-1 \cdot 66)] \mathrm{V} \\
& =2 \cdot 00 \mathrm{~V}
\end{aligned}
$$

Nernst equation for the cell at 298 K is

$$
\begin{aligned}
\mathrm{E}_{\text {cell }} & =\mathrm{E}_{\text {cell }}^{\mathrm{o}}-\frac{0 \cdot 059 \mathrm{~V}}{n} \log \frac{\left[\mathrm{Al}^{3+}\right]^{2}}{\left[\mathrm{Cu}^{2+}\right]^{3}} \\
& =2 \cdot 00 \mathrm{~V}-\frac{0 \cdot 059 \mathrm{~V}}{6} \log \frac{(0 \cdot 15)^{2}}{(0 \cdot 025)^{3}}
\end{aligned}
$$

$$
\begin{aligned}
& =2.00 \mathrm{~V}-\frac{0.059}{6} \mathrm{~V}\left[\log (0.15)^{2}-\log (0.025)^{3}\right] \\
& =2.00 \mathrm{~V}-\frac{0.059 \mathrm{~V}}{6}[2 \log 0.15-3 \log 0.025] \\
& =2.00 \mathrm{~V}-\frac{0.059 \mathrm{~V}}{6}[2 \times(-0.8239)-3 \times(-1.6020)] \\
& =2.00 \mathrm{~V}-\frac{0.059 \mathrm{~V}}{6}[4.806-1.6478] \\
& =\left(2.00-\frac{0.059 \times 3.1582}{6}\right) \mathrm{V} \\
& =(2.00-0.031) \mathrm{V}=\mathbf{1 . 9 6 8 9} \mathbf{V} . \\
& \boldsymbol{O r}
\end{aligned}
$$

(i) Higher the reduction potential, easier to reduce and hence strongest oxidising agent. Thus, the strongest oxidising agent out of the three given choices : $\mathrm{MnO}_{4}^{-}$
(ii) (a) Molar conductivity : It is defined as the conductance of a solution containing 1 gram mole of the electrolyte placed between two plates kept 1 cm apart.
(b) Nature of electrolyte : Strong electrolyte.

Reason : For strong electrolyte molar conductivity increases linearly with dilution.
(c)

$$
\begin{aligned}
\wedge_{m}^{o} & =\text { Intercept on } y \text {-axis } \\
& =\mathbf{1 5 0} \mathbf{S ~ c m}^{\mathbf{~ m o l}}
\end{aligned}
$$

(d)

$$
\begin{aligned}
\wedge_{m} & =\wedge_{m}^{\mathrm{o}}-\mathrm{A} \sqrt{\mathrm{C}} \\
\mathrm{~A} & =- \text { Slope of the graph }=-\frac{y_{2}-y_{1}}{x_{2}-x_{1}}
\end{aligned}
$$

$$
\begin{aligned}
& \mathrm{A}=- \text { slope }=-\frac{y_{2}-y_{1}}{x_{2}-x_{1}} \\
&=-\frac{(149 \cdot 0-147 \cdot 8) \mathrm{Scm}^{2} \mathrm{~mol}^{-1}}{(0 \cdot 010-0 \cdot 022)\left(\mathrm{molL}^{-1}\right)^{1 / 2}} \\
&=-\frac{1 \cdot 2}{(-0 \cdot 012)} \mathrm{S} \mathrm{~cm}^{2} \mathrm{~mol}^{-1} /\left(\mathrm{mol} \mathrm{~L}^{-1}\right)^{1 / 2} \\
&=\mathbf{1 0 0 ~ S ~ c m} \\
& \mathbf{~ m o l}^{-1} /\left(\mathrm{mol} \mathrm{~L}^{-1}\right)^{1 / 2} .
\end{aligned}
$$

## SAMPLE QUESTION PAPERS (SOLVED)

## Chemistry (Theory)-XII

Time Allowed : 3 hours
Maximum Marks : 70
General Instructions: Read the following instructions carefully.
(a) There are 33 questions in this question paper. All questions are compulsory.
(b) Section A: Q. No. 1 to 2 are case-based questions having four MCQs or Reason Assertion type based on given passage each carrying 1 mark.
(c) Section A: Question 3 to 16 are MCQs and Reason Assertion type questions carrying 1 mark each.
(d) Section : B Q. No. 17 to 25 are short answer questions and carry 2 marks each.
(e) Section : C Q. No. 26 to 30 are short answer questions and carry 3 marks each.
(f) Section D: Q. No. 31 to 33 are long answer questions carrying 5 marks each.
$(g)$ There is no overall choice. However, internal choices have been provided.
(h) Use of calculators and log tables is not permitted.

## Sample Question Paper - 1

## SECTION - A (Objective Type)

1. Read the passage given below and answer the questions (i) to (iv) that follow :

Adsorption is a surface phenomenon and it differs from absorption which occurs throughout the body of the substance which absorbs. In physisorption, the attractive forces are mainly van der Walls' forces while in chemisorption actual bonding occurs between the particles of adsorbent and adsorbate. Generally, easily liquefying gases are adsorbed more easily on the surface of a solid as compared to the gases which are liquefied with difficulty. Adsorption increases with the increase in pressure and decreases as the temperature is increased.

## Choose the most appropriate answer.

(i) Which of the following gas will be most easily adsorbed ?
(a) $\mathrm{H}_{2}$
(b) $\mathrm{CH}_{4}$
(c) CO
(d) $\mathrm{NH}_{3}$.
(ii) Adsorption of gases on the solid surface is exothermic because during adsorption,
(a) enthalpy increases
(b) entropy decreases
(c) entropy increases
(d) free energy increases.
(iii) When $\mathrm{SO}_{2}$ is adsorbed on charcoal, the $\mathrm{SO}_{2}$ is called :
(a) Adsorbent
(b) Adsorbate
(c) Adsorber
(d) Absorber.
(iv) In physical adsorption, the forces associated are
(a) ionic bonds
(b) covalent bonds
(c) van der Walls'
(d) hydrogen bond.

OR
In chemical adsorption, which is not true ?
(a) It is irreversible
(b) Increases with increase in temperature.
(c) Highly specific in nature
(d) Enthalpy of adsorption is low.
2. Read the following passage and answer the questions (i) to (iv) that follow :

With dilute nitric acid at low temperature ( 298 K ), phenol yields a mixture of ortho and para nitrophenols.

The ortho and para isomers can be separated by steam distillation. o-Nitrophenol is steam volatile due to intramolecular hydrogen bonding while $p$-nitrophenol is less volatile due to intermolecular hydrogen bonding which causes the association of molecules.

$o$-Nitrophenol (Intramolecular H-bonding)

With concentrated nitric acid, phenol is converted to 2, 4, 6-trinitrophenol(Picric acid). The yield of the reaction is poor.
The question given below consist of Assertion and Reason. Use the following key to select the correct answer.
(a) If the both assertion and reason are correct and reason is correct explanation for assertion.
(b) If both assertion and reason are correct but reason is not correct explanation for assertion.
(c) If assertion is correct but reason is incorrect.
(d) If assertion is wrong but reason is correct.
(i) Assertion : Phenol gives $o$ - and $p$-nitrophenols on nitration with conc. $\mathrm{HNO}_{3}$ and conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$ mixture. Reason : The - OH group in phenol is $o$ - and $p$-directing.
(ii) Assertion : o-Nitrophenol is less soluble in water than $m$ - and $p$-isomers. Reason : The $m$ - and $p$-nitrophenols exist as associated molecules.
(iii) Assertion : Out of $o$ - and $p$-nitrophenols, $o$-nitrophenol has lesser boiling point.

Reason : It is due to the presence of intramolecular H -bonding in $o$-nitrophenol.
(iv) Assertion : A mixture of $o$ - and $p$-nitrophenols can be separated by steam distillation.

Reason : Boiling point of $p$-nitrophenol is less than that of $o$-nitrophenol.
OR
Assertion : A mixture of o-nitrophenol and water can be separated by using separating funnel.
Reason : o-Nitrophenol is immiscible with water.
Multiple Choice Questions (Q. No. 3 to Q. No. 11)

## - Select the correct answer

3. The unit of specific conductance is:
(a) ohm
(b) $\mathrm{ohm}^{-1} \mathrm{~cm}^{-1}$
(c) $\mathrm{ohm}^{-1} \mathrm{~cm}$
(d) $\mathrm{ohm}^{2}$.
4. Hot concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}$ acts as a moderately strong oxidising agent. It oxidises both metals and non-metals. Which of the following elements is oxidised by hot conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$ into two gaseous products ?
(a) Cu
(b) S
(c) C
(d) Zn

OR
Which of the following is most basic?
(a) $\mathrm{BiH}_{3}$
(b) $\mathrm{NH}_{3}$
(c) $\mathrm{PH}_{3}$
(d) $\mathrm{AsH}_{3}$.
5. Which of the following compounds is not coloured ?
(a) $\mathrm{FeCl}_{3}$
(b) $\mathrm{CrCl}_{3}$
(c) $\mathrm{TiCl}_{3}$
(d) $\mathrm{HgI}_{2}$.
6. How many ions are given by $\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{Br}^{2}\right] \mathrm{Cl}_{2}$ complex in water ?
(a) 4
(b) 2
(c) 6
(d) 3 .
7. In the given alkyl halides which one has the minimum boiling point?
(a) $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{~F}$
(b) $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{I}$
(c) $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{Cl}$
(d) $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{Br}$.
OR

In following reaction, product $\mathbf{P}$ is;

(a)

(b)

(c)

(d)

8. Which of the following is most basic in aqueous solution?
(a) $\mathrm{CH}_{3} \mathrm{NH}_{2}$
(b) $\left(\mathrm{CH}_{3}\right)_{2} \mathrm{NH}$
(c) $\left(\mathrm{CH}_{3}\right)_{3} \mathrm{~N}$
(d) $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2}$.
9. Which of the following is not present in DNA ?
(a) Adenine
(b) Guanine
(c) Thymine
(d) Uracil.
10. $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH} \xrightarrow[443 \mathrm{~K}]{\mathrm{H}_{2} \mathrm{SO}_{4}} \mathrm{X}$; what is X ?
(a) $\mathrm{CH}_{2}=\mathrm{CH}_{2}$
(c) $\mathrm{CH}_{3}-\mathrm{OCH}_{2} \mathrm{CH}_{3}$
(b) $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OC}_{2} \mathrm{H}_{5}$
(c) $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{HSO}_{4}$.
OR

Which is weakest acid in the following ?
(a) $\mathrm{CH}_{3} \mathrm{OH}$
(b) $\left(\mathrm{CH}_{3}\right)_{2} \mathrm{CHOH}$
(c) $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}$
(d) $\left(\mathrm{CH}_{3}\right)_{3} \mathrm{COH}$
11. $2 \mathrm{HCHO}+$ conc. $\mathrm{NaOH} \longrightarrow \mathrm{CH}_{3} \mathrm{OH}+\mathrm{HCOONa}$ is
(a) Cross aldol condensation
(b) Aldol condensation
(c) Cannizzaro reaction
(d) Rosenmund reaction.

OR
The acid that does not contain carboxylic acid group is
(a) Acetic acid
(b) Formic acid
(c) Picric acid
(d) None.

## Assertion-Reason Type Questions (Q. No. 12 to Q. No. 16)

- The questions given below consists of Assertion and Reason. Use the following key to select the correct answer.
(a) If both assertion and reason are correct statements and reason is the correct explanation of the assertion.
(b) If both assertion and reason are correct statements, but reason is not the correct explanation of the assertion.
(c) If assertion is correct, but reason is wrong.
(d) If assertion is wrong, but reason is correct.

12. Assertion: Copper is less reactive than hydrogen.

Reason : $\mathrm{E}_{\mathrm{Cu}^{2+} / \mathrm{Cu}}^{\circ}$ is negative.
13. Assertion : The presence of a large number of Schottky defects lowers the density of NaCl crystal.

Reason : In NaCl , there are approximately $10^{6}$ Schottky pairs per $\mathrm{cm}^{3}$ at room temperature.
14. Assertion: Molarity of a solution changes with temperature.

Reason : The volume of solution changes with change in temperature.
15. Assertion: Order of a reaction can be zero or fractional.

Reason : We cannot determine order of a reaction from its balanced chemical equation.
16. Assertion: The two strands in double strand helix structure of DNA are complementary to each other.

Reason : Disulphide bonds are formed between specific pairs of bases.
OR
Assertion: Glucose reacts with hydroxylamine to form an oxime and also adds a molecule of hydrogen cyanide to give cynohydrin.
Reason : The carbonyl group present in open chain structure of glucose is an aldehyde group.

## SECTION - B

The following questions (Q.No. 17-25) are short answer type I and carry 2 marks each.
17. State Raoult's law for solutions of volatile liquid components. Taking a suitable example, explain the meaning of positive deviation from Raoult's law.

Define the term 'osmotic pressure'. Describe how the molecular mass of a substance can be determined on the basis of osmotic pressure measurement.
18. In the first transition series,
(i) Name the element showing maximum number of oxidation states
(ii) Name the element which shows only +3 oxidation state
19. Complete the following reaction equations:
(i) $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{~N}_{2} \mathrm{Cl}+\mathrm{KI} \longrightarrow \ldots \ldots$.
(ii)

20. (i) Arrange the following in increasing order of basic strength in water :
$\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2},\left(\mathrm{C}_{2} \mathrm{H}_{5}\right)_{2} \mathrm{NH},\left(\mathrm{C}_{2} \mathrm{H}_{5}\right)_{3} \mathrm{~N}$ and $\mathrm{NH}_{3}$.
(ii) Arrange the following in increasing order of basic strength in gas phase :
$\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NH}_{2},\left(\mathrm{C}_{2} \mathrm{H}_{5}\right)_{2} \mathrm{NH},\left(\mathrm{C}_{2} \mathrm{H}_{5}\right)_{3} \mathrm{~N}$ and $\mathrm{CH}_{3} \mathrm{NH}_{2}$.
21. Write one chemical reaction each to illustrate the following:
(i) Hoffmann's bromamide reaction
(ii) Gabriel phthalimide synthesis
22. Explain, why ortho-nitrophenol is more acidic than ortho-methoxyphenol ?
23. Convert (i) Propene to propan-1-ol. (ii) Phenol to benzoquinone.
24. A solution containing 16 g of a substance in 200 g of diethyl ether boils at $36 \cdot 86^{\circ} \mathrm{C}$, whereas pure ether boils at $35 \cdot 60^{\circ} \mathrm{C}$. Determine the molecular mass of the solute. (for ether $\mathrm{K}_{b}=2.02 \mathrm{~K} \mathrm{~kg} \mathrm{~mol}^{-1}$ )

OR
Calculate the temperature at which a solution containing 54 g of glucose, $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$, in 250 g of water will freeze. $\left[\mathrm{K}_{f}\right.$ for water $=1.86 \mathrm{~K} \mathrm{~kg} \mathrm{~mol}^{-1}$ and Freezing point of water $=273.15 \mathrm{~K}$ ]
25. The resistance of a conductivity cell containing 0.001 M KCl solution at 298 K is $1500 \Omega$. What is the cell constant if the conductivity of 0.001 M KCl solution at 298 K is $0.146 \times 10^{-3} \mathrm{~S} \mathrm{~cm}^{-1}$ ?

Zinc rod is dipped in 0.01 M solution of zinc sulphate when temperature is 298 K . Calculate the electrode potential of zinc. [Given $\mathrm{E}_{\mathrm{Zn}^{2+} / \mathrm{Zn}}^{\circ}=-0.76 \mathrm{~V}, \log 10=1$ ]

## SECTION - C

26. Copper crystallises with face centred cubic unit cell. If the radius of copper atom is $127 \cdot 8 \mathrm{pm}$, calculate the density of copper metal. (Atomic mass of $\mathrm{Cu}=63.55 \mathrm{u}$ and avogadro's number $\mathrm{N}_{\mathrm{A}}=6.02 \times 10^{23} \mathrm{~mol}^{-1}$ )

OR
Iron has a body centred cubic unit cell with the cell dimension of 286.65 pm . Density of iron is $7.87 \mathrm{~g} \mathrm{~cm}^{-3}$. Use this information to calculate Avogadro's number. (Atomic mass of $\mathrm{Fe}=56.0 \mathrm{u}$ )
27. Answer the following :
(i) Which neutral molecule would be isoelectronic with $\mathrm{CIO}^{-}$?
(ii) Which form of sulphur show paramagnetic behaviour?
(iii) Noble gases have very low boiling points. Why ?
28. How would you account for the following situations ?
(i) The transition metals generally form coloured compounds.
(ii) $\quad E_{M^{\circ}}{ }^{2+}$ values are not regular for first row transtition elements ( $3 d$-series).
(iii) With $3 d^{4}$ configuration, $\mathrm{Cr}^{2+}$ acts as a reducing agent but $\mathrm{Mn}^{3+}$ acts as an oxidising agent, (Atomic numbers, $\mathrm{Cr}=24, \mathrm{Mn}=25$ ).
29. (a) What is the basis of formation of the spectro-chemical series ?
(b) Give IUPAC names of the following complexes.
(i) $\mathrm{K}_{2}\left[\mathrm{Zn}(\mathrm{OH})_{4}\right]$
(ii) $\mathrm{K}_{3}\left[\mathrm{Al}\left(\mathrm{C}_{2} \mathrm{O}_{4}\right)_{3}\right]$
30. (i) Why are haloalkanes more reactive towards nucleophilic substitution reactions than haloarenes ?
(ii) Which one of the following two substances undergoes $\mathrm{S}_{\mathrm{N}} 1$ reaction faster and why?

Or

(iii) Write the structure of 1-bromo-4-sec-butyl-2-methylbenzene.
(i) Why is sulphuric acid not used during the reaction of alcohols with KI ?
(ii) Draw the structures of major monohalo products in each of the following reactions :
(a)

(b)

## SECTION - D

## The following questions Q.No. 31-33 are long answer type questions.

31. (a) Derive the general expression for half-life of a first order reaction.
(b) The decomposition of $\mathrm{NH}_{3}$ on platinum surface is a zero order reaction. What would be the rates of production of $\mathrm{N}_{2}$ and $\mathrm{H}_{2}$ if $k=2.5 \times 10^{-4} \mathrm{~mol} \mathrm{~L} \mathrm{~L}^{-1} \mathrm{~s}^{-1}$ ?
(a) List the factors that determine the rate of a chemical reaction.
(b) The half-life for decay of radioactive ${ }^{14} \mathrm{C}$ is 5730 years. An archaeological artefact containing wood had only $80 \%$ of the ${ }^{14} \mathrm{C}$ activity as found in a living tree. Calculate the age of the artefact.

2, 3
32. (a) Assign reasons for the following :
(i) The negative value of electron gain enthalpy of fluorine is less than that of chlorine.
(ii) $\mathrm{SF}_{6}$ is much less reactive than $\mathrm{SF}_{4}$.
(iii) Of all the noble gases, only xenon is known to form well-established chemical compounds.
(b) Write the balanced chemical equation for the reaction of $\mathrm{Cl}_{2}$ with hot and conc. NaOH . Is this reaction disproportionation reaction? Explain why ?

## OR

(a) (i) Give reasons for the following : Where R is alkyl group, $\mathrm{R}_{3} \mathrm{P}=\mathrm{O}$ exists but $\mathrm{R}_{3} \mathrm{~N}=\mathrm{O}$ does not.
(ii) At room temperature $\mathrm{N}_{2}$ is much less reactive.
(b) Draw the structures of the following :
(i) $\mathrm{XeOF}_{4}$ (ii) $\mathrm{S}_{8}(s)$ (iii) $\mathrm{ClF}_{3}(\mathrm{~g})$
33. (a) Giving a chemical equation for each, illustrate the following processes :
(i) Cannizzaro reaction
(ii) Acetylation
(iii) Decarboxylation
(b) State chemical tests to distinguish between the following pairs of compounds :
(i) Propanal and Propanone
(ii) Phenol and Benzoic acid

## OR

(a) An organic compound $\mathbf{A}$ contains $69.77 \%$ carbon, $11.63 \%$ hydrogen and the rest is oxygen. The molecular mass of the compound is 86 . It does not reduce Tollen's reagent but forms an addition product with sodium hydrogensulphite and gives positive iodoform test. On vigorous oxidation, it gives ethanoic and propanoic acids. Write the possible structure of the compound $\mathbf{A}$.
(b) Write the chemical tests to distinguish between the following pairs of compounds :
(i) Acetophenone and Benzophenone
(ii) Ethanal and Propanal

## SOLUTION

1. (i) (d) Explanation : Ammonia $\left(\mathrm{NH}_{3}\right)$ can easily be liquefied due to extensive intermolecular H -bonding.
(ii) (b) Explanation : Adsorption of gases on solid surface is exothermic because during adsorption, entropy decreases.
(iii) (b) Explanation : The substance being adsorbed is called adsorbate.
(iv) (c) Explanation : In physical adsorption, the forces of attraction between adsorbent and adsorbate are van der Walls' forces.

## OR

(d) Explanation : In chemical adsorption, enthalpy of adsorption is more.
2. (i) (d) Correct assertion : Phenol gives $o$-and $p$-nitrophenol on nitration with dilute $\mathrm{HNO}_{3}$ at low temperature (298 K).
(ii) (c) Correct reason : Intramolecular H-bonding in $o$-nitrophenol makes it less soluble in water as compared to $m$ - and $p$-nitrophenols.
(iii) (a) Reason is the correct explanation for assertion.
(iv) (c) Correct reason : Boiling point of $o$-nitrophenol is less than $p$-nitrophenol.

## OR

(a) Reason is the correct explanation for assertion.
3. (b) Explanation : Unit of specific conductance is ohm ${ }^{-1} \mathrm{~cm}^{-1}$.
4. (c) Explanation : Hot conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$ oxidises carbon to $\mathrm{CO}_{2}$ and in the process it itself is reduced to $\mathrm{SO}_{2}$. Both $\mathrm{CO}_{2}$ and $\mathrm{SO}_{2}$ are gases at room temperature.

(b) Explanation : Out of all the hydrides of Group 15, $\mathrm{NH}_{3}$ is most basic. It is due to small atomic size of N -atom.
5. (d) Explanation : $\mathrm{HgI}_{2}$ is white. It is due to $5 d^{10}$ configuration of $\mathrm{Hg}^{2+}$ ion with no unpaired electron.
6. (d) Explanation : $\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{Br}^{2} \mathrm{Cl}_{2}(a q) \longrightarrow\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{Br}\right]^{2+}(a q)+2 \mathrm{Cl}^{-}(a q)\right.$
7. (a) Explanation : Out of all the given alkyl halides, fluoride has the lowest boiling point. It is due to lowest molecular mass.

```
OR
```

(b) Explanation :

(P)
8. (b) Explanation : Alkyl amines are more basic than aryl amines. Out of $1^{\circ}$, $2^{\circ}$ and $3^{\circ}$ alkyl amines, $2^{\circ}$ alkyl amine is most basic in aqueous solution.
9. (d) Explanation : Uracil is not present in DNA.
10. (a) Explanation :

OR
(d) Explanation : Acidic nature of $1^{\circ}, 2^{\circ}$ and $3^{\circ}$ alcohols is in the order $3^{\circ}<2^{\circ}<1^{\circ}$.
11. (c) Explanation : It is an example of Cannizzaro reaction.

OR
(c) Explanation : Picric acid is 2, 4, 6-trinitrophenol. It does not have a carboxylic acid group.
12. (c) Correct reason : $\mathrm{E}_{\mathrm{Cu}^{2+} / \mathrm{Cu}}^{\circ}$ is positive.
13. (b) Correct explanation : The density of NaCl crystal get lowered because a large number of ions (cations and anions) are missing from their lattice sites.
14. (a) Reason is the correct explanation for the assertion.
15. (c) Correct reason : The sum of powers of the concentration terms of the reactants in the rate law expression is called the order of the reaction.
16. (c) Correct reason : Hydrogen bonds are formed between specific pairs of bases.

OR
(a) Reason is the correct explanation for the assertion.
17. Raoult's law states that for a solution of volatile liquids, the partial vapour pressure of each component in the solution is directly proportional to its mole fraction.
When the solute-solvent interaction is weaker than those between the solute-solute and solvent-solvent molecules, then solution shows positive deviation from Raoults law because the partial pressure of each component is greater. For example, a mixture of ethanol and acetone or carbon disulphide and acetone behave in this manner. 1/2,1/2

The extra pressure applied on the solution side that just stops the flow of solvent to solution through semipermeable membrane is called osmotic pressure of the solution.
If $\pi$ is the osmotic pressure of a solution containing $n_{2}$ moles of non-volatile, non-electrolyte solute in V L of solution at T K.

$$
\pi=\frac{n_{2}}{\mathrm{~V}} \mathrm{RT}
$$

where $\mathrm{R}=0.0821 \mathrm{~L} \mathrm{~atm} \mathrm{~K} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$

$$
\begin{equation*}
\pi=\frac{\mathrm{W}_{2}}{\mathrm{M}_{2}} \frac{\mathrm{RT}}{\mathrm{~V}} \tag{1}
\end{equation*}
$$

where $\mathrm{W}_{2}$ is the mass of the solute and $\mathrm{M}_{2}$ is its molar mass.

$$
\mathrm{M}_{2}=\frac{\mathrm{W}_{2} \mathrm{RT}}{\pi \mathrm{~V}}
$$

Thus, knowing the quantities $\mathrm{W}_{2}, \mathrm{~T}, \pi$ and V , we can calculate the molar mass, $\mathrm{M}_{2}$ of the
solute.
18. (i) In first transition series, manganese $(Z=25)$ shows maximum number of oxidation states. It shows +2 , +3 , $+4,+5,+6$ and +7 oxidation states.
(ii) In first transition series Scandium ( Sc ) shows only +3 oxidation state.
19. (i) $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{~N}_{2}{ }^{+} \mathrm{Cl}^{-}+\mathrm{KI} \longrightarrow \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{I}+\mathrm{KCl}+\mathrm{N}_{2}$
(ii) $\mathrm{CH}_{2}=\mathrm{CH}_{2}+\mathrm{Br}_{2} \longrightarrow \mathrm{CH}_{2}(\mathrm{Br})-\mathrm{CH}_{2}(\mathrm{Br})$
20. (i) $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2}<\mathrm{NH}_{3}<\left(\mathrm{C}_{2} \mathrm{H}_{5}\right)_{3} \mathrm{~N}<\left(\mathrm{C}_{2} \mathrm{H}_{5}\right)_{2} \mathrm{NH}$ in water
(ii) $\mathrm{CH}_{3} \mathrm{NH}_{2}<\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NH}_{2}<\left(\mathrm{C}_{2} \mathrm{H}_{5}\right)_{2} \mathrm{NH}<\left(\mathrm{C}_{2} \mathrm{H}_{5}\right)_{3} \mathrm{~N}$ in gas phase.
21. (i) Hoffmann Bromamide reaction :
$\mathrm{R}-\mathrm{CONH}_{2}+\mathrm{Br}_{2}+4 \mathrm{NaOH} \longrightarrow \mathrm{R}-\mathrm{NH}_{2}+\mathrm{Na}_{2} \mathrm{CO}_{3}+2 \mathrm{NaBr}+2 \mathrm{H}_{2} \mathrm{O}$
Amide $\quad 1^{\circ}$ Amine
(ii) Gabriel Phthalimide synthesis :

N -Alkylphthalimide
OR
(i) Carbylamine reaction :

(ii) Coupling reaction :

22. o-Nitrophenol is more acidic than o-methoxyphenol.

Electrons withdrawing groups like $-\mathrm{NO}_{2}$ decreases the electron density on O-atom of phenolic group, especially when present at $o$ or $p$-position w.r.t. - OH group. This increases the acidic nature. On the other hand, electron donating groups like $-\mathrm{OCH}_{3}$ increases the electron density on O -atom of phenolic group, especially when present at $o$ or $p$-position w.r.t. -OH group. This decreases the acidic nature.
23. (i) Propene to propan-1-ol

(ii) Phenol of benzoquinone

24. $\Delta \mathrm{T}_{b}=(36 \cdot 86-35 \cdot 60)^{\circ} \mathrm{C}=1 \cdot 26^{\circ} \mathrm{C}=1 \cdot 26 \mathrm{~K}$

No. of moles of solute $=\frac{16 \mathrm{~g}}{\mathrm{M}}$
where M is molar mass of the solute
Molality of solution, $m=\left[\frac{16 \mathrm{~g}}{\mathrm{M}}\right] \times\left[\frac{1000}{200 \mathrm{~kg}}\right]$
$\Delta \mathrm{T}_{b}=\mathrm{K}_{b} m$
$1.26 \mathrm{~K}=\left(2.02 \mathrm{~K} \mathrm{~kg} \mathrm{~mol}^{-1}\right) \times\left(\frac{16 \mathrm{~g}}{\mathrm{M}}\right) \times\left(\frac{1000}{200 \mathrm{~kg}}\right)$
$\mathrm{M}=128.25 \mathrm{~g} \mathrm{~mol}^{-1}$
OR
$\Delta \mathrm{T}_{f}=\mathrm{K}_{f} m$
No. of moles of glucose $=\frac{54 \mathrm{~g}}{180 \mathrm{~g} \mathrm{~mol}^{-1}}=\frac{54}{180} \mathrm{~mol}$
Molality of glucose solution, $m=\left(\frac{54}{180} \mathrm{~mol}\right) \times\left(\frac{1000}{250 \mathrm{~kg}}\right)=1.20 \mathrm{~mol} \mathrm{~kg}^{-1}$
$\Delta \mathrm{T}_{f}=\mathrm{K}_{f} m=\left(1.86 \mathrm{~K} \mathrm{~kg} \mathrm{~mol}^{-1}\right) \times\left(1.20 \mathrm{~mol} \mathrm{~kg}{ }^{-1}\right)=2.23 \mathrm{~K}$
Temperature at which solution freezes
$\mathrm{T}_{f}=\mathrm{T}^{\circ}{ }_{f}-\Delta \mathrm{T}_{f}=(273 \cdot 15-2 \cdot 23) \mathrm{K}=\mathbf{2 7 0 . 9 2} \mathbf{K}$
25. $\mathrm{R}=\rho(l / \mathrm{A}) \quad$ (Writing the correct formula carries one mark) 1

Cell constant, $l / \mathrm{A}=\mathrm{R} / \rho=\mathrm{R} . \kappa$
Here $R=1500 \Omega$ and
$\kappa=0 \cdot 146 \times 10^{-3} \mathrm{~S} \mathrm{~cm}^{-1}=1.46 \times 10^{-4} \Omega^{-1} \mathrm{~cm}^{-1}$
$\therefore$ Cell constant $=(1500 \Omega) \times\left(1.46 \times 10^{-4} \Omega^{-1} \mathrm{~cm}^{-1}\right)=\mathbf{0 . 2 1 9} \mathbf{c m}^{\mathbf{- 1}}$
(Deduct $1 / 2$ mark if proper units are not given in the answer).
OR
$\mathrm{Zn}^{2+}(a q)+2 e^{-} \longrightarrow \mathrm{Zn}(s)$
Here $n=2$

$$
\mathrm{E}_{\mathrm{Zn}}{ }^{2+} / \mathrm{Zn}, \mathrm{E}_{\mathrm{Zn}^{2+} / \mathrm{Zn}}^{\circ}-\frac{0 \cdot 059}{2} \log \frac{1}{\left[\mathrm{Zn}^{2+}\right]}
$$

$$
\begin{aligned}
& =-0.76-\frac{0.059}{2} \log \frac{1}{10^{-2}} \\

27. (i) ClF (or any other)
(ii) In vapour state, sulphur exists as $\mathrm{S}_{2}$ molecule, like $\mathrm{O}_{2}$ it has two unpaired electrons in $\pi *$-orbitals (antibonding orbitals).
(iii) Noble gases have weak inter-atomic dispersion forces and as such they liquefy at very low temperatures.
28. (i) Transition metal ions contain unpaired electrons and are excited to higher energy levels called $d$ - $d$ transition. This leads to absorption in visible region.
(ii) It is mainly due to the fact that variation in enthalpy of atomisation and enthalpy of hydration of $\mathrm{M}^{2+}$ ions is not regular across the $3 d$-series.
(iii) $\mathrm{Cr}^{2+}$ is reducing as its configuration changes from $d^{4}$ to $d^{3}$ the latter having half filled $t_{2 g}$ level whereas $\mathrm{Mn}^{3+}$ to $\mathrm{Mn}^{2+}$ results in half filled $d^{5}$ configuration.
29. (a) Ligands are arranged in the increasing order of field strength based on absorption of light of complexes with different ligands (extent of splitting).
(i) $\mathrm{K}_{2}\left[\mathrm{Zn}(\mathrm{OH})_{4}\right]$
potassium tetrahydroxidozincate(II)
(ii) $\mathrm{K}_{3}\left[\mathrm{Al}\left(\mathrm{C}_{2} \mathrm{O}_{4}\right)_{3}\right]$
potassium trioxalatoaluminate(III)
30. (i) Aryl halides are less reactive towards nucleophilic reagents because of any of the following reasons.
(a) Resonance effect stabilisation.
(b) $s p^{2}$-hybridization in haloarenes and $s p^{3}$ in haloalkanes.
(c) Instability of phenyl cation
(d) Possible repulsion between election rich nucleophile and electron rich arenes.
(ii)
 undergoes $\mathrm{S}_{\mathrm{N}} 1$ reaction faster. It is because of the greater stability of secondary carbocation than primary carbocation.
(iii)

1-Bromo-4-sec-butyl-2-methylbenzene
OR
(i) $\mathrm{H}_{2} \mathrm{SO}_{4}$ cannot be used along with KI in the conversion of alcohol to an alkyl iodide as it converts KI to corresponding HI and then oxidises it to $\mathrm{I}_{2}$.
(ii)
(a)

31. (a) Half life of a first order reaction :

$$
\begin{align*}
k & =\frac{2 \cdot 303}{t} \log \frac{[\mathrm{R}]_{0}}{[\mathrm{R}]}  \tag{i}\\
\text { at } \quad t & =t_{1 / 2} ;[\mathrm{R}]=\frac{[\mathrm{R}]_{0}}{2}
\end{align*}
$$

Equation (i) becomes

$$
\begin{align*}
k & =\frac{2 \cdot 303}{t_{1 / 2}} \log \frac{[\mathrm{R}]_{0}}{[\mathrm{R}]_{0} / 2} \\
\text { or } \quad t_{1 / 2} & =\frac{2.303}{k} \log 2 \\
t_{1 / 2} & =\frac{2.303}{k} \times 0.301 \\
t_{1 / 2} & =\frac{0.693}{k} \tag{1}
\end{align*}
$$

(b) $2 \mathrm{NH}_{3}(g) \xrightarrow{\mathrm{Pt}} \mathrm{N}_{2}(g)+3 \mathrm{H}_{2}(g)$

Rate $=-\frac{d\left[\mathrm{NH}_{3}\right]}{d t}=k\left[\mathrm{NH}_{3}\right]^{0}=k$

$$
\begin{equation*}
=2.5 \times 10^{4} \mathrm{~mol} \mathrm{~L}^{-1} \mathrm{~s}^{-1} \tag{1}
\end{equation*}
$$

$$
-\frac{1}{2} \frac{d\left[\mathrm{NH}_{3}\right]}{d t}=+\frac{d\left[\mathrm{~N}_{2}\right]}{d t}=+\frac{1}{3} \frac{d\left[\mathrm{H}_{2}\right]}{d t}
$$

Rate of production of $\mathrm{N}_{2}=\frac{d\left[\mathrm{~N}_{2}\right]}{d t}=-\frac{1}{2} \frac{d\left[\mathrm{NH}_{3}\right]}{d t}$

$$
=\frac{1}{2} \times\left(2.5 \times 10^{-4} \mathrm{~mol} \mathrm{~L}^{-1} \mathrm{~s}^{-1}\right)=\mathbf{1 . 2 5} \times \mathbf{1 0}^{-4} \mathbf{~ m o l ~ L}{ }^{\mathbf{1}} \mathrm{s}^{\mathbf{- 1}}
$$

Rate of production of hydrogen $=\frac{d\left[\mathrm{H}_{2}\right]}{d t}=-\frac{3}{2} \frac{d\left[\mathrm{NH}_{3}\right]}{d t}$

$$
=\frac{3}{2} \times\left(2.5 \times 10^{-4} \mathrm{~mol} \mathrm{~L}^{-1} \mathrm{~s}^{-1}\right)=\mathbf{3 . 7 5} \times \mathbf{1 0}^{-4} \mathbf{m o l ~ L}^{\mathbf{- 1}} \mathrm{s}^{\mathbf{- 1}}
$$

OR
(a) Factors affecting rate of chemical reaction are as follows:
(i) Concentration of reactants
(ii) Temperature
(iii) Presence of catalyst
(iv) Surface area
(v) Activation energy
(vi) Radiation (any four)
(b)

$$
k=\frac{0 \cdot 693}{t_{1 / 2}}
$$

$$
\begin{align*}
k & =\frac{0 \cdot 693}{5730 \mathrm{y}}=1 \cdot 21 \times 10^{-4} \mathrm{y}^{-1} \\
{[\mathrm{R}]_{0} } & =100 \text { (say), }[\mathrm{R}]=80 \\
t & =\frac{2 \cdot 303}{k} \log \frac{[\mathrm{R}]_{0}}{[\mathrm{R}]} \\
t & =\frac{2.303}{1 \cdot 21 \times 10^{-4} \mathrm{y}^{-1}} \log \frac{100}{80}=\frac{2.303}{1 \cdot 21 \times 10^{-4} \mathrm{y}^{-1}} \log 1 \cdot 25 \\
t & =\frac{2 \cdot 303 \times 0 \cdot 0969 \mathrm{y}}{1 \cdot 21 \times 10^{-4}}=\mathbf{1 8 4 5} \text { years } \tag{1}
\end{align*}
$$

(i) It is due to stronger interelectronic repulsions in relatively compact $2 p$-subshell of F .
32. (a) (i) It is due to stronger interelectronic repulsions in relatively compact $2 p$-subshell of F . 1
(ii) The much less reactivity of $\mathrm{SF}_{6}$ can be explained on the basis of its exceptional stability, which is due to steric reasons.
(iii) Because of comparatively lower ionisation enthalpy of Xe (comparable to that of $\mathrm{O}_{2}$ ) as compared to those of other noble gases.
(b) $\left.\quad \mathrm{Cl}_{2}+\mathrm{H}_{2} \mathrm{O} \longrightarrow \mathrm{HCl}+\mathrm{HOCl}\right] \times 3$
$\left.\mathrm{NaOH}+\mathrm{HCl} \longrightarrow \mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}\right] \times 3$
$\left.\mathrm{NaOH}+\mathrm{HOCl} \longrightarrow \mathrm{NaOCl}+\mathrm{H}_{2} \mathrm{O}\right] \times 3$
$3 \mathrm{NaOCl} \longrightarrow \mathrm{NaClO}_{3}+2 \mathrm{NaCl}$
$3 \mathrm{Cl}_{2}+6 \mathrm{NaOH} \longrightarrow 5 \mathrm{NaCl}+\mathrm{NaClO}_{3}+3 \mathrm{H}_{2} \mathrm{O}$
Yes. It is a disproportionation reaction. Here O . S . of Cl simultaneously increases from 0 (in $\mathrm{Cl}_{2}$ ) to +5 (in $\mathrm{NaClO}_{3}$ ) and decreases from 0 (in $\mathrm{Cl}_{2}$ ) to -1 (in NaCl ).

## OR

(a) (i) Nitrogen does not have vacant $d$-orbitals in its valence shell. Therefore, it cannot extend its covalency to five and $d \pi-p \pi$ bonding is not possible. As a result, the molecules of $\mathrm{R}_{3} \mathrm{~N}=\mathrm{O}$ does not exist. However, phosphorus and rest of the members of the Group 15 have vacant $d$-orbitals in the valence shell which can be involved in $d \pi-p \pi$ bonding. Under the circumstances $\mathrm{R}_{3} \mathrm{P}=\mathrm{O}$ molecule can exist.
(ii) Very low reactivty of $\mathrm{N}_{2}$ at room temperature is due to the high bond enthalpy of $\mathrm{N} \equiv \mathrm{N}$ bond.
(b) Structures of $\mathrm{XeOF}_{4}, \mathrm{~S}_{8}(s)$ and $\mathrm{ClF}_{3}(g)$

$\mathrm{XeOF}_{4}$

$\mathrm{S}_{8}(\mathrm{~s})$

$\mathrm{ClF}_{3}(\mathrm{~g})$
33. (a) (i) Cannizzaro Reaction : Adehydes which do not have an $\alpha$-hydrogen atom, undergo self oxidation and reduction reaction on treatment with concentrated alkali.

(ii) Acetylation : The introduction of acetyl $\left(\mathrm{CH}_{3} \mathrm{CO}\right)$ group in alcohols or phenols is known as acetylation.
$\mathrm{Ar} / \mathrm{R}-\mathrm{OH}+(\mathrm{RCO})_{2} \mathrm{O} \stackrel{\mathrm{H}^{+}}{\rightleftharpoons} \mathrm{Ar} / \mathrm{ROCOR}+\mathrm{RCOOH}$

$$
\mathrm{R} / \mathrm{ArOH}+\mathrm{RCOCl} \xrightarrow{\text { Pyridine }} \mathrm{R} / \mathrm{ArOCOR}+\mathrm{HCl}
$$

(iii) Decarboxylation : Carboxylic acids lose carbon dioxide to form hydrocarbons when their sodium salts are heated with sodalime $(\mathrm{NaOH}+\mathrm{CaO})$.
The reaction is known as decarboxylation.

(Note : Award full marks for correct chemical equation ; award $1 / 2$ mark if only statement is written)
(b) (i) Propanal and propanone : Propanone gives yellow ppt of iodoform $\left(\mathrm{CHI}_{3}\right)$ on heating with $\mathrm{NaOH} / \mathrm{I}_{2}$ while propanal does not give this test.
Propanal gives Tollen's test/or Fehling's test while propanone does not give any of these tests.
(Any one test)
(ii) Phenol and benzoic acid : 1 Add neutral $\mathrm{FeCl}_{3}$ to both of them. Phenol gives violet colour. 2. Benzoic acid gives effervescence with $\mathrm{NaHCO}_{3}(a q)$ while phenol does not react with $\mathrm{NaHCO}_{3}(a q)$.
(Any one test)
OR
(a)

| Element | Percentage/Atomic mass | Molar ratio |
| :---: | :---: | :---: |
| C | $69 \cdot 77 / 12=5 \cdot 81$ | $5 \cdot 71 / 1 \cdot 16=5$ |
| H | $11 \cdot 63 / 1=11 \cdot 63$ | $11 \cdot 63 / 1 \cdot 16=10$ |
| O | $18 \cdot 60 / 6=1 \cdot 16$ | $1 \cdot 16 / 1 \cdot 16=1$ |

Empirical formula : $\mathrm{C}_{5} \mathrm{H}_{10} \mathrm{O}$
Empirical formula mass $=60+10+16=86$
Molecular mass $=86$ (given)
$n=\frac{\text { Mol. mass }}{\text { E.F. mass }}=\frac{86}{86}=1$
$\therefore$ Molecular formula $=(\text { E.F. })_{n}=\mathrm{C}_{5} \mathrm{H}_{10} \mathrm{O}$
It is a ketone as it gives ethanoic and propanoic acids on oxidation. Hence the compound is $\mathbf{C H}_{\mathbf{3}} \mathbf{C O C H}_{\mathbf{2}} \mathbf{C H}_{\mathbf{2}} \mathbf{C H}_{\mathbf{3}}$
(b) (i) Acetophenone and Benzophenone : Heat both of them with $\mathrm{NaOH} / \mathrm{I}_{2}$. Only acetophenone forms yellow ppt. of iodoform.
(ii) Ethanal and Propanal : Heat both of them with $\mathrm{NaOH} / \mathrm{I}_{2}$. Only ethanal forms yellow ppt. of iodoform.

# Sample Question Paper - 2 

Time Allowed : $\mathbf{3}$ Hours
Maximum Marks : 70
General instructions : Same as in Sample Paper 1.

## Section - A (Objective Type)

## Passage Based Questions (Q. No. 1 to Q. No. 2)

- Read the following passage and answer the questions that follow.

1. Adsorption arises due to the fact that the surface particles of the adsorbent are not in the same environment as the particles inside the bulk. Inside the adsorbent all the forces acting between the particles are mutually balanced but on the surface the particles are not surrounded by atoms or molecules of their kind on all sides, and hence they possess unbalanced or residual attractive forces. These forces of the adsorbent are responsible for attracting the adsorbate particles on its surface. The extent of adsorption increases with the increase of surface area per unit mass of the adsorbent at a given temperature and pressure.
Another important factor featuring adsorption is the heat of adsorption. During adsorption, there is always a decrease in residual forces of the surface, i.e., there is decrease in surface energy which appears as heat. Adsorption, therefore, is invariably and exothermic process. In other words, $\Delta \mathrm{H}$ of adsorption is always negative. When a gas is adsorbed, the freedom of movement of its molecules become restricted. This amounts to decrease in the entropy of the gas after adsorption i.e., $\Delta \mathrm{S}$ is negative. Adsorption is thus accompaned by decrease in enthalpy as well as decrease in entropy of the system. For a process to be spontaneous, the thermodynamic requirement is that, at constant temperature and pressure, $\Delta \mathrm{G}$ must be negative. i.e., there is a decrease in Gibbs energy. On the basis of equation, $\Delta \mathrm{G}=\Delta \mathrm{H}-\mathrm{T} \Delta \mathrm{S}$, $\Delta \mathrm{G}$ can be negative if $\Delta \mathrm{H}$ has sufficiently high negative value as - $\mathrm{T} \Delta \mathrm{S}$ is positive. Thus, in an adsorption process, which is spontaneous, a combination of these two factors makes $\Delta \mathrm{G}$ negative. As the adsorption proceeds, $\Delta \mathrm{H}$ becomes less and less negative ultimately $\Delta H$ becomes equal to $T \Delta S$ and $\Delta \mathrm{G}$ becomes zero. At this state equilibrium is attained.

## Choose the most appropriate answer.

(i) At a given temperature and pressure, the extent of adsorption,
(a) decreases with decrease in surface area of adsorbent.
(b) increases with decrease in surface area of adsorbent.
(c) decreases with increase in surface area of adsorbent.
(d) None of these.
(ii) Adsorbption is an
(a) exothermic process and sign of $\Delta \mathrm{H}$ is +ve .
(b) exothermic process and sign of $\Delta \mathrm{H}$ is -ve.
(c) endothermic process and sign of $\Delta \mathrm{H}$ is -ve.
(d) endothermic process and sign of $\Delta \mathrm{H}$ is +ve .
(iii) During adsorption.
(a) randomness increases and $\Delta S$ is +ve .
(b) randomness increases and $\Delta \mathrm{S}$ is -ve
(c) randomness decreases and $\Delta \mathrm{S}$ is +ve .
(d) randomness decreases and $\Delta \mathrm{S}$ is -ve.
(iv) As adsorption is a spontaneous process,
(a) $\Delta \mathrm{G}$ is always zero
(b) $\Delta \mathrm{G}$ is always +ve
(c) $\Delta \mathrm{G}$ is always -ve.
(d) None of these.

During adsorption at constant temperature and pressure, at equilibrium
(a) $\Delta \mathrm{G}=0$
(b) $\Delta \mathrm{H}=0$
(c) $\Delta \mathrm{S}=0$
(d) All of these.
2. Read the following passage and answer the questions that follow :

Aldehydes and ketones undergo nucleophilic addition reactions. Some examples of nucleophilic addition reactions are addition of $\mathrm{HCN}, \mathrm{NaHSO}_{3}$, Grignard reagents, alcohols, ammonia and ammonia derivatives.
Aldehydes are generally more reactive than ketones in nucleophilic addition reactions due to steric and electronic reasons. Sterically, the presence of two relatively large substituents in ketones hinders the approach of nucleophile to carbonyl carbon more than in aldehydes having only one such substituent. Electronically, aldehydes are more reactive than ketones because two alkyl groups reduce the electrophilicity of the carbonyl carbon more effectively than in former.

In general, aromatic aldehydes and ketones are less reactive than aliphatic aldehydes and ketones. For example, propanal is more reactive than benzaldehyde in nucleophilic addition reactions. This is because the carbon atom of the carbonyl group of benzaldehyde is less electrophilic than carbon atom of the carbonyl group present in propanal. The polarity of carbonyl group is reduced in benzaldehyde due to resonance.
The questions given below consist of Assertion and Reason. Use the following key to select the correct answer.
(a) If both assertion and reason are correct and reason is correct explanation for assertion.
(b) If both assertion and reason are correct but reason is not correct explanation for assertion.
(c) If assertion is correct but reason is incorrect.
(d) If assertion is wrong but reason is correct.
(i) Assertion : Carbonyl compounds take part in nucleophilic addition reactions.

Reason : These reactions are initiated by nucleophilic attack at the electron deficient carbon atom.
(ii) Assertion : The addition of ammonia derivatives to carbonyl compounds is carried in weakly acidic medium.

Reason : In weakly acidic medium attacking nucleophile is also protonated.
(iii) Assertion : Benzaldehyde is less reactive towards nucleophilic addition than acetaldehyde.

Reason : In benzaldehyde polarity of the carbonyl group is reduced due to resonance.
(iv) Assertion : Propanone is more reactive towards nucleophilic addition than propanal.

Reason : It is due to more steric hinderance in propanone.

## OR

Assertion : Acetone is less reactive than acetaldehyde in nucleophilic addition reaction.
Reason : In acetone, polarity of carbonyl group is reduced due to resonance.
3. Reaction of ethylamine with chloroform in alcholic KOH gives
(a) $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{CN}$
(b) $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NC}$
(c) $\mathrm{CH}_{3} \mathrm{CN}$
(d) $\mathrm{CH}_{3} \mathrm{NC}$.
4. If value of $\mathrm{K}_{b}$ is large, then value of $p \mathrm{~K}_{b}$ will be
(a) more
(b) less
(c) same
(d) None of these.
$\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NH}_{2}+\mathrm{HNO}_{2} \longrightarrow \mathrm{X}$,
X is :
(a) $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$
(b) $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NHOH}$
(c) $\mathrm{C}_{2} \mathrm{H}_{6}$
(d) $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NO}_{2}$.
5. Common name of

(a) Vanillin
(b) Benzaldehyde
(c) Salicyldehyde
(d) Salicylic Acid.

The solution used to preserve biological specimens in
(a) Tollen's Reagent
(b) Formalin
(c) Vanillin
(d) Acetone.
6. Which one is the complementary base of adenine in one strand to that in other strand of DNA ?
(a) Guanine
(b) Cytocine
(c) Thymine
(d) Uracil.
7. Which amino acids are essential building units of proteins ?
(a) $\alpha$-amino acids
(b) $\beta$-amino acids
(c) $\gamma$-amino acids
(d) None of these.
8. $\alpha-\mathrm{D}(+)$ glucose and $\beta-\mathrm{D}(+)$ glucose are
(a) enantiomers
(b) geometrical isomers
(c) epimers
(d) anomers.
9. In the following which is the strongest acid ?
(a) $\mathrm{CH}_{3} \mathrm{OH}$
(b) $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}$
(c) $\left(\mathrm{CH}_{3}\right)_{2} \mathrm{CHOH}$
(d) $\left(\mathrm{CH}_{3}\right)_{3} \mathrm{COH}$

OR

X will be
(a) $\mathrm{CH}_{2}=\mathrm{CH}_{2}$
(b) $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{HSO}_{4}$
(c) $\left(\mathrm{C}_{2} \mathrm{H}_{5}\right)_{2} \mathrm{O}$
(d) $\left(\mathrm{C}_{2} \mathrm{H}_{5}\right)_{2} \mathrm{SO}_{4}$
10. On adding $\mathrm{AgNO}_{3}$ solution in 1 mol of $\mathrm{PdCl}_{2} \cdot 4 \mathrm{NH}_{3}$, two moles of AgCl are formed the secondary valence of Pd in the complex will be
(a) 0
(b) 2
(c) 4
(d) 1 .

OR
Oxidation state of Pt in $\left[\mathrm{Pt}\left(\mathrm{C}_{2} \mathrm{H}_{4}\right) \mathrm{Cl}_{3}\right]^{-}$is
(a) +1
(b) +2
(c) +3
(d) +4 .
11. The oxidation number of cobalt in $\mathrm{K}\left[\mathrm{Co}(\mathrm{CO})_{4}\right]$ is
(a) +1
(b) -1
(c) +3
(d) -3 .

## Assertion-Reason Type Questions (Q. No. 12 to Q. No. 16)

- The questions given below consists of Assertion and Reason. Use the following key to select the correct answer.
(a) Both assertion and reason are correct statements and reason is the correct explanation of the assertion.
(b) Both assertion and reason are correct statements, but reason is not the correct explanation of the assertion.
(c) Assertion is correct, but reason is wrong.
(d) Assertion is wrong, but reason is correct.

12. Assertion. Conductivity of all electrolytes decreases on dilution.

Reason. On dilution number of ions per unit volume decreases.
13. Assertion. Colloidal solution show colligative properties.

Reason. Colloidal particles are larger in size than 1000 nm .
14. Assertion. When NaCl is added to water, a depression in freezing point is observed.

Reason. The lowering of vapour pressure of a solution causes depression in the freezing point.
15. Assertion. In Daniell cell, if concentration of $\mathrm{Cu}^{2+}$ and $\mathrm{Zn}^{2+}$ ions are doubled, the emf of the cell does not change.

Reason. If the concentration of the ions in contact with the metal is doubled, the electrode potential will also be doubled.

## OR

Assertion. For a cell reaction :

$$
\mathrm{Zn}(\mathrm{~s})+\mathrm{Cu}^{2+}(\mathrm{aq}) \rightarrow \mathrm{Zn}^{2+}(\mathrm{aq})+\mathrm{Cu}(\mathrm{~s}) \text { at equilibrium, voltmeter gives zero reading. }
$$

Reason. At the equilibrium, there is no change in the concentration of $\mathrm{Cu}^{2+}$ and $\mathrm{Zn}^{2+}$ ions.
16. Assertion. $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$ is a weaker base than phenol but a stronger nucleophile than phenol

Reason. In phenol, the lone pair of electrons on oxygen is withdrawn towards the ring due to reasonance.

## SECTION - B

The following questions (Q.No. 17-25) are short answer type I and carry 2 marks each.
17. Treatment of alkyl chlorides with aqueous KOH leads to the formation of alcohols but in the presence of alcoholic KOH , alkenes are major products. Explain
18. Explain as to how the two complexes of nickel, $\left[\mathrm{Ni}(\mathrm{CN})_{4}\right]^{2-}$ and $\left[\mathrm{Ni}(\mathrm{CO})_{4}\right]$, have different structures but do not differ in their magnetic behaviour. (At. no. of $\mathrm{Ni}=28$ )
19. State Henry's law correlating the pressure of a gas and its solubility in a solvent and mention two applications for the law.
20. A first order decomposition reaction takes 40 minutes for $30 \%$ decomposition. Calculate its half life period.

OR
The half-life for radioactive decay of ${ }^{14} \mathrm{C}$ is 5730 years. An archaelogical artifact contained wood that has only $80 \%$ of the ${ }^{14} \mathrm{C}$ found in living tree. Estimate the age of the sample.
21. What is meant by the 'rate constant, $k$ of a reaction ? If the concentration be expressed in mol $\mathrm{L}^{-1}$ units and time in seconds, what would be the units for rate constant, $k$
(i) for a zero order reaction and
(ii) for a first order reaction?
22. Heptane and octane form ideal solution. At 373 K , the vapour pressures of the two liquid components are $105 \cdot 2 \mathrm{k} \mathrm{Pa}$ and 46.8 kPa respectively. What will be the vapour pressure of a mixture of 26.0 g of heptane and 35.0 g of octane ?

## OR

An antifreeze solution is prepared from 222.6 g of ethylene glycol, $\mathrm{C}_{2} \mathrm{H}_{4}(\mathrm{OH})_{2}$ and 200 g of water. Calculate the molality of the solution. If the density of the solution is $1.072 \mathrm{~g} \mathrm{~mL}^{-1}$, then what shall be the molarity of the solution ?
23. Differentiate between lyophilic and lyophobic sols giving one example
24. (i) Explain why fluorine forms only one oxo-acid (HOF).
(ii) Give the formula and describe the structure of a noble gas species which is isostructural with $\mathrm{ICl}_{4}^{-}$.
25. An element has a body centred cubic (bcc) structure with a cell edge of 288 pm . The density of element is $7 \cdot 2 \mathrm{~g} / \mathrm{cm}^{3}$. How many atoms are present in 208 g of the element?

## OR

An element with molar mass $2.7 \times 10^{-2} \mathrm{~kg} \mathrm{~mol}^{-1}$ forms a cubic unit cell with edge length 405 pm . If its density is $2.7 \times 10^{23} \mathrm{~kg} \mathrm{~m}^{-3}$, what is the nature of cubic unit cell?

## SECTION - C

The following questions (Q.No. 26-31) are short answer Type II and carry 3 Marks each.
26. Account for the following observations :
(i) $p \mathrm{~K}_{b}$ for aniline is more than that for methylamine.
(ii) Methylamine solution in water reacts with ferric chloride solution to give a precipitate of ferric hydroxide.
(iii) Aniline does not undergo Friedel-Craft's reaction.

OR
(a) Identify X and Y in the following:

(b) Amino group is $o$, $p$-directing for aromatic electrophilic substitution reactions. Why does aniline on nitration gives $m$-nitroaniline in significant amount?
27. (a) Explain why phenols are more acidic than alcohols. 1
(b) Predict the products of the following reactions:
(i) $\left(\mathrm{CH}_{3}\right)_{3} \mathrm{C}-\mathrm{O}-\mathrm{C}_{2} \mathrm{H}_{5}+\mathrm{HI} \longrightarrow$
(ii) $\mathrm{CH}_{3}-\mathrm{CH}_{2}-\mathrm{CH}_{2}-\mathrm{O}-\mathrm{CH}_{3}+\mathrm{HI} \longrightarrow$

How are the following conversions carried out?
(i) Ethyl magnesium chloride $\longrightarrow$ Propan-1-ol
(ii) Methyl magnesium bromide $\longrightarrow$ 2-Methylpropan-2-ol
(iii) Benzyl chloride $\longrightarrow$ Benzyl alcohol
28. (a) Give IUPAC name of :

(b) Complete the following chemical equations :
(i)

(ii)

29. Write chemical equations for the following processes :
(i) Sulphur is heated with conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$.
(ii) $\mathrm{XeF}_{6}$ in completely hydrolysed.
(iii) $\mathrm{PtF}_{6}$ and xenon are mixed together.
30. Write IUPAC names of the following co-ordination compounds
(i) $\left[\mathrm{Pt}(e n)_{3}\left(\mathrm{NO}_{3}\right)\right]_{2}$
(ii) $\mathrm{K}_{2}\left[\mathrm{PdCl}_{4}\right]$
(iii) $\left[\mathrm{Pt}\left(\mathrm{NH}_{3}\right)_{2} \mathrm{Cl}\left(\mathrm{NH}_{2} \mathrm{CH}_{3}\right)\right] \mathrm{Cl}$

## SECTION - D

Following questions (Q.No. 31-33) are long answer type and carry 5 marks each.
31. Conductivity of 0.00241 M acetic acid solution is $7.896 \times 10^{-5} \mathrm{~S} \mathrm{~cm}^{-1}$. Calculate its molar conductivity in this solution. If $\Lambda_{m}^{0}$ for acetic acid be $390.5 \mathrm{~S} \mathrm{~cm}^{2} \mathrm{~mol}^{-1}$, what would be its dissociation constant ?

OR
(a) A voltaic cells is set up at $25^{\circ} \mathrm{C}$ with the following half cells :

$$
\mathrm{Al} / \mathrm{Al}^{3+}(0 \cdot 001 \mathrm{M}) \text { and } \mathrm{Ni} / \mathrm{Ni}^{2+}(0 \cdot 50 \mathrm{M})
$$

Write an equation for the reaction that occurs when the cell generates an electric current and determine the cell potential.

$$
\mathrm{E}_{\mathrm{Ni}^{2+} / \mathrm{Ni}}^{\circ}=-0.25 \mathrm{~V} \text { and } \mathrm{E}_{\mathrm{Al}^{3+} / \mathrm{Al}}^{\circ}=-1.66 \mathrm{~V}
$$

(b) Calculate the maximum work that can be obtained from this cell under standard conditions.
32. (a) Complete the following reaction statements by giving the missing starting material, reagent or product as required :
(i) $\ldots \ldots \cdot \frac{\mathrm{O}_{3}}{\mathrm{Zn}-\mathrm{H}_{2} \mathrm{O}} 2<=\mathrm{O}$

(b) Describe the following reactions:
(i) Cannizzaro reaction
(ii) Cross-aldol condensation
(a) How would you account for the following?
(i) Aldehydes are more reactive than ketones towards nucleophiles.
(ii) The boiling points of aldehydes and ketones are lower than that of the corresponding acids.
(iii) The aldehydes and ketones undergo a number of addition reactions.
(b) Give chemical tests to distinguish between :
(i) Acetaldehyde and benzaldehyde
(ii) Propanone and propanol
33. Assign reasons for the following :
(i) The enthalpies of atomisation of transition elements are high.
(ii) The transition metals and many of their compounds act as good catalyst.
(iii) Why is the highest oxidation state of a transition metal exhibited in its oxide or fluoride only.
(iv) The $\mathrm{E}^{\circ}$ value for the $\mathrm{Mn}^{3+} / \mathrm{Mn}^{2+}$ couple is much more positive than that for $\mathrm{Cr}^{3+} / \mathrm{Cr}^{2+}$.
(v) Scandium $(Z=21)$ does not exhibit variable oxidation states and yet it is regarded as a transition element.

OR
(a) What may be the possible oxidation states of the transition metals with the following $d$-electronic configurations in the ground state of their atoms: $3 d^{3} 4 s^{2}, 3 d^{5} 4 s^{2}$ and $3 d^{6} 4 s^{2}$.
Indicate relative stability of oxidation states in each case.
(b) Explain giving reasons:
(i) Transition metals and many of the compounds show paramagnetic behaviour. 1
(ii) The transition metals generally form coloured compounds. $3 \times 1=3$

## SOLUTION

1. (i) (a) Explanation : Extent of adsorption decreases with decrease in surface area.
(ii) (b) Explanation : Adsorption is an exothermic process and $\Delta \mathrm{H}$ is -ve .
(iii) (d) Explanation : During adsorption, randomness decreases and $\Delta \mathrm{S}$ is -ve .
(iv) (c) Explanation : Adsorption is a spontaneous process and as such $\Delta \mathrm{G}$ is always -ve .

OR
(d) Explanation : During adsorption, at equilibrium, $\Delta \mathrm{G}=0, \Delta \mathrm{H}=0$ and $\Delta \mathrm{S}=0$.
2. (i) (a) Reason is the correct explanation for assertion.
(ii) (c) Correct reason : Attacking nucleophile is not protonated in weakly acidic medium.
(iii) (a) Reason is the correct explanation for assertion.
(iv) (d) Correct assertion : Propanone is less reactive towards nucleophilic addition than propanal.

OR
(c) Correct reason : In acetone, the presence of two methyl groups increases steric hinderance.
3. (b) Explanation :

4. (b) Explanation :

$$
p \mathrm{~K}_{b}=\log \frac{1}{\mathrm{~K}_{b}}
$$

Hence, more $\mathrm{K}_{b}$ implies less $p \mathrm{~K}_{b}$
5. (c) Explanation : Common name of o-hydroxybenzaldehyde is salicyldehyde.

## OR

(b) Explanation : Formalin (an aqueous solution of formaldehyde) is used to preserve biological specimens.
6. (c) Explanation : In DNA, complementry base of adenine is thymine.
7. (a) Explanation : $\alpha$-Amino acids form the basic building units of proteins.
8. (d) Explanation : $\alpha-\mathrm{D}(+)$ glucose and $\beta-\mathrm{D}(+)$ glucose are anomers.
9. (a) Explanation : Acidic strength of alcohols follows the order $1^{\circ}>2^{\circ}>3^{\circ}$. Further methanol is more acidic than ethanol.

## OR

(c) Explanation :
$2 \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH} \xrightarrow[413 \mathrm{~K}]{\text { conc. } \mathrm{H}_{2} \mathrm{SO}_{4}} \mathrm{C}_{2} \mathrm{H}_{5}-\mathrm{O}-\mathrm{C}_{2} \mathrm{H}_{5}+\mathrm{H}_{2} \mathrm{O}$
10. (c) Explanation : As one mole of the complex gives two moles of AgCl , the complex contains two ionisable $\mathrm{Cl}^{-}$ions and has the structure :

$$
\left[\mathrm{Pd}\left(\mathrm{NH}_{3}\right)_{4}\right] \mathrm{Cl}_{2}
$$

Thus, secondary valency of Pd in the complex is four.
OR
(b) Explanation : Let O.S. of $\mathrm{Pt}=x$
O.S. of $\mathrm{Cl}^{-}=-1$ and $\mathrm{C}_{2} \mathrm{H}_{4}=0$
$\therefore x+0+3(-1)=-1$
or $x=+2$
11. (b) Explanation : Let O.S. of $\mathrm{Co}=x$, O.S. of $\mathrm{K}^{+}=+1$ and O.S. of $\mathrm{CO}=0$
$\therefore+1+x+4 \times 0=0$
$\therefore x=-1$
12. (a) Reason is the correct explanation for assertion.
13. (c) Correct explanation. Colloidal particles share their kinetic energy with the particles of the dispersion medium. 1
14. (a) Reason is the correct explanation for assertion.
15. (b) Correct reason : The effect of concentration on electrode potential is guided by Nernst equation. On doubling the concentration, emf will remain unchanged since $\frac{\left[\mathrm{Zn}^{2+}\right]}{\left[\mathrm{Cu}^{2+}\right]}$ will remain same.

OR
(a) Reason is the correct explanation for assertion.
16. (d) Correct assertion : $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$ is a stronger base than phenol and also a stronger nucleophile than phenol.
17. In aqueous KOH , neucleophile is $\mathrm{OH}^{-}$. It can easily attack alkyl chloride ( $\mathrm{S}_{\mathrm{N}} 1$ or $\mathrm{S}_{\mathrm{N}} 2$ ) to give an alcohol (substitution). In case of alcoholic KOH , nucleophile is bulkier ${ }^{-}$OR ions. It will prefer to act as a base and abstract a proton rather than approach a tetravalent carbon due to steric reasons and vice-versa. Thus, the main product of the reaction in this case will be an alkene.
18. $\left[\mathrm{Ni}(\mathrm{CN})_{4}\right]^{2-}: d s p^{2}$-hybridization

Structure : Square planar
Diamagnetic in nature as its $3 d$-orbitals contain paired electrons. (Or diagram) $1 / 2+1 / 2$
$\left[\mathrm{Ni}(\mathrm{CO})_{4}\right]: s p^{3}$-hybridization
Structure : Tetrahedral
Diamagnetic in nature as its $3 d$-orbitals contain paired electrons. (Or diagram) $1 / 2+1 / 2$
19. Henry's Law : Henry's law states that at a constant temperature, the solubility of a gas in a liquid is directly proportional to the pressure of the gas over the solution.
Applications of Henry's Law :
(i) To increase the solubility of $\mathrm{CO}_{2}$ in soft drinks and soda water, the bottle is sealed under high pressure.
(ii) Scuba divers must cope with high concentrations of dissolved nitrogen when breathing air at high pressure underwater. To avoid this air is diluted with He.
(iii) At high altitudes the partial pressure of oxygen is less than that at the ground level. Low blood oxygen causes anoxia.
20. $k=\frac{2 \cdot 303}{t} \log \frac{[\mathrm{~A}]_{0}}{[\mathrm{~A}]}$

$$
[\mathrm{A}]_{0}=100 \text { (say) } ;[\mathrm{A}]=100-30=70, t=40 \mathrm{~min}
$$

$$
k=\frac{2.303}{40 \mathrm{~min}} \log \frac{100}{70}=\frac{2.303 \times 0.155}{40 \mathrm{~min}}=0.00892 \mathrm{~min}^{-1}
$$

$$
\begin{aligned}
& t_{1 / 2}=\frac{0.693}{k} \\
& t_{1 / 2}=\frac{0.693}{0.00892 \mathrm{~min}^{-1}}=77.7 \mathrm{~min}
\end{aligned}
$$

## OR

Radioactive decay follows first order kinetics.

$$
\text { Decay constant, } \begin{aligned}
k & =\frac{0.693}{t_{1 / 2}}=\frac{0.693}{5730} \mathrm{yr}^{-1} \\
t & =\frac{2.303}{k} \log \frac{[\mathrm{R}]_{0}}{[\mathrm{R}]}=\frac{2.303}{\left(0.693 / 5730 \mathrm{yr}^{-1}\right)} \log \frac{100}{80} \\
& =\frac{2.303 \times 5730}{0.693} \times 0.0969 \mathrm{yr}=\mathbf{1 8 4 5} \text { years }
\end{aligned}
$$

21. Rate constant ' $k$ ' of a reaction is defined as the rate of reaction when the concentration of the reactant(s) is unity or Rate constant is the proportionality factor in the rate law.
For an $n$th order reaction

$$
\begin{aligned}
k & =\frac{\text { rate }}{(\text { conc. })^{n}} \\
\text { units of } k & =\frac{\mathrm{mol} \mathrm{~L}^{-1} \mathrm{~s}^{-1}}{\left(\mathrm{~mol} \mathrm{~L}^{-1}\right)^{n}}=\mathrm{mol}^{1-n} \mathrm{~L}^{n-1} \mathrm{~s}^{-1}
\end{aligned}
$$

(i) Units for ' $k$ ' for a zero order $(n=0)$ reaction $=\operatorname{mol~L}^{-1} \mathrm{~s}^{-1}$
(ii) Units for ' $k$ ' for a first order $(n=1)$ reaction $=\mathrm{s}^{-1}$
22. Molar mass of heptane $\left(\mathrm{C}_{7} \mathrm{H}_{16}\right)=100 \mathrm{~g} \mathrm{~mol}^{-1}$; Molar mass of octane $\left(\mathrm{C}_{8} \mathrm{H}_{18}\right)=114 \mathrm{~g} \mathrm{~mol}^{-1}$
V.P. of heptane at $373 \mathrm{~K}, p_{\mathrm{A}}{ }^{\circ}=105.2 \mathrm{k} \mathrm{Pa}$
V.P. of octane at $373 \mathrm{~K}, p_{\mathrm{B}}{ }^{\circ}=46.8 \mathrm{k} \mathrm{Pa}$

No. of moles of heptane, $n_{A}=\frac{26 \cdot 0 \mathrm{~g}}{100 \mathrm{~g} \mathrm{~mol}^{-1}}=0.26 \mathrm{~mol}$
No. of moles of octane, $n_{\mathrm{B}}=\frac{35.0 \mathrm{~g}}{114 \mathrm{~g} \mathrm{~mol}^{-1}}=0.31 \mathrm{~mol}$
Mole fraction of heptane, $x_{\mathrm{A}}=\frac{n_{\mathrm{A}}}{n_{\mathrm{A}}+n_{\mathrm{B}}}$
$=\frac{0.26 \mathrm{~mol}}{(0.26+0.31) \mathrm{mol}}=0.456$
Mole fraction of octane, $x_{\mathrm{B}}=1-x_{\mathrm{A}}=1-0.456=0.544$

$$
\begin{aligned}
p_{\mathrm{A}} & =p_{\mathrm{A}}{ }^{\circ} x_{\mathrm{A}}=105.2 \mathrm{k} \mathrm{~Pa} \times 0.456 \\
& =47.97 \mathrm{k} \mathrm{~Pa} \\
p_{\mathrm{B}} & =p_{\mathrm{B}}{ }^{\circ} x_{\mathrm{A}}=46.8 \mathrm{k} \mathrm{~Pa} \times 0.544 \\
& =25.45 \mathrm{k} \mathrm{~Pa} \\
p_{s} & =p_{\mathrm{A}}+p_{\mathrm{B}}=(47.97+25.45) \mathrm{k} \mathrm{~Pa} \\
& =73.42 \mathrm{k} \mathrm{~Pa} \\
& \quad \text { OR }
\end{aligned}
$$

Mass of the solute, $\mathrm{C}_{2} \mathrm{H}_{4}(\mathrm{OH})_{2}=222.6 \mathrm{~g}$
Molar mass of $\mathrm{C}_{2} \mathrm{H}_{4}(\mathrm{OH})_{2}=62 \mathrm{~g} \mathrm{~mol}^{-1}$
$\therefore \quad$ Moles of the solute $=\frac{222 \cdot 6 \mathrm{~g}}{62 \mathrm{~g} \mathrm{~mol}^{-1}}=3.59 \mathrm{~mol}$
Mass of the solvent $=200 \mathrm{~g}=0.200 \mathrm{~kg}$

$$
\begin{aligned}
& \text { Molality }=\frac{\text { Moles of solute }}{\text { Mass of solvent }(\mathrm{kg})}=\frac{3 \cdot 59 \mathrm{~mol}}{0 \cdot 200 \mathrm{~kg}} \\
&=\mathbf{1 7 . 9 5} \mathbf{~ m o l ~ k g} \\
&
\end{aligned}
$$

Total mass of the solution $=422.6 \mathrm{~g}$

$$
\begin{aligned}
\text { Volume of the solution } & =\frac{\text { Mass }}{\text { Density }}=\frac{422.6 \mathrm{~g}}{1.072 \mathrm{~g} \mathrm{~mL}^{-1}} \\
& =394.2 \mathrm{~mL}=0.3942 \mathrm{~L} \\
\text { Molarity } & =\frac{\text { Moles of solute }}{\text { Volume of solution (L) }}=\frac{3.59 \mathrm{~mol}}{0.3942 \mathrm{~L}} \\
& =\mathbf{9 . 1} \mathbf{~ m o l ~ L}^{-1}
\end{aligned}
$$

23. Lyophobic sol : The sol in which there is no affinity between the dispersion medium and dispersed phase is called a lyophobic sol. For example, a sol of sulphur in water is a lyophobic sol.
24. (i) Fluorine cannot show higher oxidation states like $+3,+5,+7$ which other halogens show e.g., chlorine shows O.S. of +3 in $\mathrm{HOClO},+5$ in $\mathrm{HOClO}_{2},+7$ in $\mathrm{HOClO}_{3}$
(ii) Structure of $\mathrm{ICI}_{4}^{-}$

Four bond pairs + Two lone pairs (Square planar)
$\mathrm{XeF}_{4}$ is isostructural with $\mathrm{ICI}_{4}^{-}$.

25.

$$
\begin{aligned}
& a=288 \mathrm{pm}=288 \times 10^{-10} \mathrm{~cm}=2 \cdot 88 \times 10^{-8} \mathrm{~cm} \\
& z=2(\text { for } b . c . c . \text { lattice }), d=7 \cdot 2 \mathrm{~g} \mathrm{~cm}^{-3}
\end{aligned}
$$

Mass of the sample, $m=208 \mathrm{~g}$
If $n$ is the number of atoms in the sample of mass $m \mathrm{~g}$, then density,

$$
\begin{aligned}
d & =\frac{z \times m}{a^{3} \times n} \\
n & =\frac{z \times m}{a^{3} \times d} \\
& =\frac{2 \times 208 \mathrm{~g}}{\left(2.88 \times 10^{-8}\right) \mathrm{cm}^{3} \times\left(7.2 \mathrm{~g} \mathrm{~cm}^{-1}\right)} \\
& =\frac{416 \times 10^{24}}{23.89 \times 7 \cdot 2}=\mathbf{2 . 4 2 \times 1 0 ^ { 2 4 }} \\
a & =405 \mathrm{pm}=405 \times 10^{-12} \mathrm{~m}=4.05 \times 10^{-10} \mathrm{~m} \\
\mathrm{M} & =2.7 \times 10^{-2} \mathrm{~kg} \mathrm{~mol}^{-1}, \mathrm{~N}_{\mathrm{A}}=6.022 \times 10^{23} \mathrm{~mol}^{-1} \\
d & =\frac{z \times \mathrm{M}}{a^{3} \times \mathrm{N}_{\mathrm{A}}} \\
z & =\frac{d \times a^{3} \times \mathrm{N}_{\mathrm{A}}}{\mathrm{M}} \\
& =\frac{\left(2.7 \times 10^{3} \mathrm{~kg} \mathrm{~m}^{-3}\right) \times\left(4.05 \times 10^{-10} \mathrm{~m}^{3} \times\left(6.022 \times 10^{23} \mathrm{~mol}^{-1}\right)\right.}{\left(2.7 \times 10^{3} \mathrm{~kg} \mathrm{~mol}^{-1}\right)} \\
& =3.99 \approx 4(\text { nearest whole number })
\end{aligned}
$$

Thus, there are 4 atoms of the element per unit cell. Therefore, element forms f.c.c. (or c.c.p.) lattice i.e., cubic unit cell is face centred.
26. (i) It is because in aniline the $-\mathrm{NH}_{2}$ group is attached directly to the benzene ring. It results in the unshared electron pair on nitrogen atom to be in conjugation with the benzene ring and thus making it less available for protonation. (or any other suitable reason)
(ii) Methylamine in water gives $\mathrm{OH}^{-}$ions which react with $\mathrm{FeCl}_{3}$ to give precipitate of ferric hydroxide/or

$$
\begin{aligned}
\mathrm{CH}_{3} \mathrm{NH}_{2}+\mathrm{H}_{2} \mathrm{O} & \longrightarrow \mathrm{CH}_{3} \stackrel{+}{\mathrm{NH}}_{3} \mathrm{-} \mathrm{OH} \rightleftharpoons \mathrm{CH}_{3} \stackrel{+}{\mathrm{NH}_{3}}+\stackrel{-}{\mathrm{O}} \mathrm{H} \\
\mathrm{Fe}^{3+}+3 \mathrm{OH}^{-} & \longrightarrow \mathrm{Fe}(\mathrm{OH})_{3}
\end{aligned}
$$

(iii) Aniline does not undergo Friedel-Crafts reaction due to salt formation with aluminium chloride- a Lewis acid. $1 \times 3=3$

OR
(a)

(b) Aniline gets protonated and is converted to anilinium ion which is $m$-directing.
27.
(a)

Both phenol and phenoxide ion are resonance stabilised, but phenoxide ion is better resonance stabilised than phenol. It is due to charge separation in the resonance structures of phenol. This shifts the equilibrium in the forward direction, making phenol fairly acidic.

$$
\mathrm{R}-\mathrm{OH} \rightleftharpoons \mathrm{R}>\mathrm{O}^{-}+\mathrm{H}^{+}
$$

The alkoxide ion formed in alcohols is destabised due to the +I effect of R -group. This reduces the acidic character of alcohols.
(b)
$\left(\mathrm{CH}_{3}\right)_{3} \mathrm{C}-\mathrm{O}-\mathrm{C}_{2} \mathrm{H}_{5}+\mathrm{HI} \longrightarrow\left(\mathrm{CH}_{3}\right)_{3} \mathrm{CI}+\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$
(ii) $\mathrm{CH}_{3}-\mathrm{CH}_{2}-\mathrm{CH}_{2}-\mathrm{O}-\mathrm{CH}_{3}+\mathrm{HI} \longrightarrow \mathrm{CH}_{3}-\mathrm{CH}_{2}-\mathrm{CH}_{2}-\mathrm{OH}+\mathrm{CH}_{3} \mathrm{I}$ OR
(i)

(ii)

Mthyl mag.bromide Propanone

29. (i)

$$
\begin{aligned}
& \text { (i) } \begin{array}{c}
\left.\left.\mathrm{H}_{2} \mathrm{SO}_{4} \text { (conc. }\right) \longrightarrow \mathrm{H}_{2} \mathrm{O}+\mathrm{SO}_{2}+[\mathrm{O}]\right] \times 2 \\
\mathrm{~S}+2[\mathrm{O}]
\end{array} \mathrm{SO}_{2} \\
& \begin{array}{l}
\text { (ii) } \\
\text { (iii) }
\end{array} \begin{array}{l}
2 \mathrm{H}_{2} \mathrm{SO}_{4}(\text { conc. })+\mathrm{S} \longrightarrow 3 \mathrm{SO}_{2}+2 \mathrm{H}_{2} \mathrm{O} \\

& \mathrm{E}_{\text {cell }}=\mathrm{E}_{\text {cell }}^{\circ}-\frac{0 \cdot 059}{n} \log \frac{\left[\mathrm{Al}^{3+}\right]^{2}}{\left[\mathrm{Ni}^{2+}\right]^{3}} \\
& =\left[\mathrm{E}^{\circ}{ }_{\mathrm{Ni}^{2+} / \mathrm{Ni}}-\mathrm{E}^{\circ} \mathrm{Al}^{3+} / \mathrm{Al}\right]-\frac{0.059}{6} \log \frac{\left[10^{-3}\right]^{2}}{\left[5 \times 10^{-1}\right]^{3}} \\
& =[-0.25 \mathrm{~V}-(-1.66 \mathrm{~V})]-\frac{0.059}{6} \mathrm{~V} \log \frac{1}{125 \times 10^{3}} \\
& =[1.66-0.25) \mathrm{V}-\frac{0.059 \mathrm{~V}}{6}\left[\log 1-\log 1.25 \times 10^{5}\right] \\
& =1.41 \mathrm{~V}+\frac{0.059}{6} \times 5.0969 \mathrm{~V}=(1.41+0 \cdot 05) \mathrm{V}=\mathbf{1 . 4 6 V}
\end{aligned}
$$

(b) Maximum work, $\Delta \mathrm{G}^{\circ}=n \mathrm{E}^{\circ} \mathrm{F}$

Hence $n=6, \mathrm{E}^{\circ}=1.41 \mathrm{~V}$ and $\mathrm{F}=96500 \mathrm{C} \mathrm{mol}^{-1}$

$$
\begin{aligned}
\therefore \quad \Delta \mathrm{G} & =-6 \times 1.41 \times 96500 \mathrm{~J} \\
& =-816390 \mathrm{~J}=-\mathbf{8 1 6 . 3 9} \mathbf{~ k J}
\end{aligned}
$$

32. 

(a) (i)

(ii)

(b) (i) Cannizzaro reaction : Aldehydes which do not have an $\alpha$-hydrogen atom, undergo self oxidation and reduction reaction on treament with concentrated alkali.

Formaldehyde (Two molecules)
Methanol Potassium formate
(or any other suitable reaction)
(ii) Cross-aldol condensation : When aldol condensation is carried out between two different aldehydes and/or ketones, it is called cross aldol condensation.

Benzaldehyde Acetophenone
(or any other suitable reaction)
(Note : Award full marks for correct chemical equation ; award $1 / 2$ mark if only statement is written)
OR
(a) (i) Because two alkyl groups in ketones reduce the positive charge on carbon atoms of the carbonyl group more effectively than in aldehydes.

OR
Sterically, the presence of two relatively large substituents in ketones hinders the approach of nucleophile to carbonyl carbon than in aldehydes having only one such substituent.
(ii) Because of the absence of hydrogen bonding in aldehydes and ketones.
(iii) Because of the presence of the $s p^{2}$-hybridised orbitals (or $\pi$-bond) of carbonyl carbon.
$1 \times 3=3$
(b) (i) Acetaldehyde and benzaldehyde : Actaldehyde gives yellow ppt. of iodoform $\left(\mathrm{CHI}_{3}\right)$ on heating with $\mathrm{NaOH} / \mathrm{I}_{2}$ whereas benzaldehyde does not give this test. (or any other suitable test)
(ii) Propanone and propanol : Propanone gives yellow ppt. of iodoform $\left(\mathrm{CHI}_{3}\right)$ on heating with $\mathrm{NaOH} / \mathrm{I}_{2}$ whereas propanol does not give this test.

OR
Propanol gives brisk effervesence on adding a piece of sodium metal whereas propanone does not give this test. $1+1$ (or any other suitable test)
33. (i) Because of larger number of unpaired electrons in their atoms they have stronger interatomic interactions and hence stronger bonding between atoms resulting in higher enthalpies of atomisation.
(ii) Because of their ability to adopt multiple oxidation states and to form complexes.
(iii) Due to small size and high electronegativity oxygen or fluorine can oxidise the metal to its highest oxidation state.
(iv) Much larger third ionisation energy of Mn (where the required change is $d^{5}$ to $d^{4}$ ) is mainly responsible for this.
(v) Because of the presence of incomplete $d$-subshell $\left(3 d^{1} 4 s^{2}\right)$.

OR
(a) $3 d^{3} 4 s^{2}$ (Vanadium) : Oxidation states $+2,+3,+4,+5$

Stable oxidation states : +4 as $\mathrm{VO}^{2+},+5$ as $\mathrm{VO}^{3+}$;
$3 d^{5} 4 s^{2}$ (Manganese) : Oxidation states $+2,+3,+4,+5,+6,+7$
Stable oxidation states : +2 as $\mathrm{Mn}^{2+},+7$ as $\mathrm{MnO}_{4}^{-}$;
$3 d^{6} 4 s^{2}$ (Iron): Oxidation states $+2,+3$
Stable oxidation state : +3 as $\mathrm{Fe}^{3+}$.
(b) (i) Transition metals and many of their compounds are generally paramagnetic in nature. This is due to the presence of partly filled $d$-subshell which has unpaired electrons. More the number of unpaired $d$-electrons, more is the paramagnetic character.
(ii) In the presence of ligands, compounds of transition elements are generally coloured. It is due to the presence of partly filled $d$-subshell. In the presence of ligands, $d$-subshell of valence shell splits into two sets of orbitals with slightly different energies. Electronic transitions ( $d-d$ transitions) between these two levels takes place with the absorption in the visible region. The colour of the compound is the complementry colour of the light absorbed, which depends upon the difference in energies of these two sets of orbitals.

# Sample Question Paper-3 

## Chemistry (Theory)-XII

Time Allowed : 3 Hours
Maximum Marks : 70
General Instructions : Same as in Sample Paper-1

Section - A (Objective Type)<br>SECTION - A

## Passage Based Questions (Q. No. 1 to Q. No. 5)

1. Read the following and answer the questions (i) to (iv) that follows :

The substitution reaction of alkyl halide mainly occurs by $\mathrm{S}_{\mathrm{N}} 1$ or $\mathrm{S}_{\mathrm{N}} 2$ mechanism. Whatever mechanism alkyl halides follow for the substitution reaction reaction to occur, the polarity of the carbon halogen bond is responsible for these substitution reactions. The rate of $\mathrm{S}_{\mathrm{N}} 1$ reactions is governed by the stability of carbocation whereas for $\mathrm{S}_{\mathrm{N}} 2$ reactions steric factor is the deciding factor. If the starting material is a chiral compound, we may end up with an inverted product or recemic mixture depending upon the type of mechanism followed by alkyl halide. Cleavage of ethers with HI is also governed by steric factor and stability of carbocation, which indicates that in organic chemistry, these two major factors help us in deciding the kind of product formed.
(i) A primary alkyl halide would prefer to undergo
(a) $\mathrm{S}_{\mathrm{N}} 1$ reaction
(b) $\mathrm{S}_{\mathrm{N}} 2$ reaction
(c) $\alpha$-Elimination
(d) Racemisation
(ii) Which of the following alkyl halides will undergo $\mathrm{S}_{\mathrm{N}} 1$ reaction most readily?
(a) $\left(\mathrm{CH}_{3}\right)_{3} \mathrm{C}-\mathrm{F}$
(b) $\left(\mathrm{CH}_{3}\right)_{3} \mathrm{C}-\mathrm{Cl}$
(c) $\left(\mathrm{CH}_{3}\right)_{3} \mathrm{C}-\mathrm{Br}$
(d) $\left(\mathrm{CH}_{3}\right)_{3} \mathrm{C}-\mathrm{I}$
(iii) Reaction of $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CH}_{2} \mathrm{Br}$ with aqueous sodium hydroxide follows
(a) $\mathrm{S}_{\mathrm{N}} 1$ mechanism
(b) $\mathrm{S}_{\mathrm{N}}{ }^{2}$ mechanism
(c) Any of the above two depending upon the temperature of reaction
(d) Saytzeff rule
(iv) Which of the following compounds will give recemic mixture on nucleophilic substitution of $\mathrm{OH}^{-}$ion ?
(i)

(ii)

(iii)

(a) $(i)$
(b) $(i),(i i),(i i i)$
(c) (ii), (iii)
(d) $(i),(i i i)$
OR

In the reaction :

Which of the following compounds will be formed?
(a)

2. Read the passage given below and answer the questions (i) to (iv) that follows :

Surface of a solid has the tendency to attract and retain the molecules of the phase with which it comes into contact. These molecules remain only at the surface and do not go deeper into the bulk. The accumulation of molecular species at the surface rather than in the bulk of a solid or liquid is termed adsorption. The molecular species or substance, which concentrates or accumulates at the surface is termed adsorbate and the material on the surface of which the adsorption takes place is called adsorbent.
Adsorption is essentially a surface phenomenon. Solids, particularly in finely divided state, have large surface area and therefore, charcoal, silica gel, alumina gel, clay, colloids, metals in finely divided state, etc. act as goods adsorbents. For example.
(a) If a gas like $\mathrm{CO}, \mathrm{Cl}_{2}, \mathrm{NH}_{3}$ or $\mathrm{SO}_{2}$ is taken in a closed vessel containing powdered charcoal, it is observed that the pressure of the gas in the enclosed vessel decreases. The gas molecules concentrate at the surface of the charcoal i.e., gases are adsorbed at the surface.
(b) Aqueous solution of raw sugar, when passed over beds of animal charcoal, becomes colourless as the colouring substances are adsorbed by the charcoal.
(c) The air becomes dry in the presence of silica gel because the water molecules get adsorbed on the surface of the gel.

It is clear from the above examples that solid surfaces can hold the gas or liquid molecules by virtue of adsorption. The process of removing an adsorbed substance from a surface on which it is adsorbed is called desorption.
The questions given below consist of Assertion and Reason. Use the following key to select the correct answer.
(a) If both assertion and reason are correct and reason is correct explanation for assertion.
(b) If both assertion and reason are correct but reason is not correct explanation for assertion.
(c) If assertion is correct but reason is incorrect.
(d) If assertion is wrong but reason is correct.
(i) Assertion : Finely divided solids are good adsorbents

Reason: It is due to their large surface area.
(ii) Assertion : When raw sugar solution is passed over beds of animal charcoal, sugar is adsorbed by the animal charcoal.

Reason : Animal charcoal is a good adsorbent due to large surface area.
(iii) Assertion : When powdered charcoal is added to a cylinder containing ammonia, the pressure is the cylinder decreases.

Reason : Powered charcoal absorbs ammonia.
(iv) Assertion : Air becomes dry in the presence of silica gel.

Reason : Silica gel adsorbs moisture from the air

## OR

Assertion : When powdered charcoal is added for cylinder containing $\mathrm{SO}_{2}$, the pressure in the cylinder decreases.
Reason : Powdered charcoal adsorbs $\mathrm{O}_{2}$.
Following questions (Q No. 3-11) are multiple choice questions carrying 1 mark each.
3. When one mole of $\mathrm{CoCl}_{3} \cdot 5 \mathrm{NH}_{3}$ was treated with excess of silver nitrate solution, 2 mol of AgCl was precipitated. The formula of the compound is :
(a) $\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{Cl}\right] \mathrm{Cl}$
(b) $\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{3} \mathrm{Cl}\right] \mathrm{Cl}_{2}$
(c) $\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{4} \mathrm{Cl}_{2}\right]\left(\mathrm{NH}_{3}\right) \mathrm{Cl}$
(d) $\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right) \mathrm{Cl}_{3}\right]\left(\mathrm{NH}_{3}\right)_{2}$
4. The absorption maxima of several octahedral complex ions are as follows :

| S.No. | Compound | $\lambda_{\text {max }}(\mathbf{n m})$ |
| :---: | :---: | :---: |
| 1. | $\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{6}\right]^{3+}$ | 475 |
| 2. | $\left[\mathrm{Co}(\mathrm{CN})_{6}\right]^{3-}$ | 310 |
| 3. | $\left[\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{3+}$ | 490 |

The correct order of $\Delta_{o}$ for the ions is :
(a) $\left[\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{3+}<\left[\mathrm{Co}(\mathrm{CN})_{6}\right]^{3-}<\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{6}\right]^{3+}$
(b) $\left[\mathrm{Co}(\mathrm{CN})_{6}\right]^{3-}<\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{6}\right]^{3+}<\left[\mathrm{Co}(\mathrm{CN})_{6}\right]^{3-}$
(c) $\left[\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{3+}<\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{6}\right]^{3+}<\left[\mathrm{Co}(\mathrm{CN})_{6}\right]^{3-}$
(d) $\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{6}\right]^{3+}<\left[\mathrm{Co}(\mathrm{CN})_{6}\right]^{3-}<\left[\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{3+}$
5. Magnetic moment 2.83 BM is given by which of the following ions?
[At. nos. $\mathrm{Ti}=22, \mathrm{Cr}=24, \mathrm{Mn}=25, \mathrm{Ni}=28$ ].
(a) $\mathrm{Mn}^{2+}$
(b) $\mathrm{Cr}^{3+}$
(c) $\mathrm{Ni}^{2+}$
(d) $\mathrm{Ti}^{3+}$
6. The correct order of reactivity in $\mathrm{S}_{\mathrm{N}} 1$ reaction for the following compounds is
(i)

(ii)

(iii)

(iv) $\mathrm{CH}_{3}-\mathrm{CH}_{2}-\mathrm{CH}_{2}-\mathrm{Cl}$
(a) (i) $>$ (ii) $>$ (iii) $>$ (iv)
(b) (ii) $>$ (i) $>$ (iii) $>$ (iv)
(c) (iii) $>$ (ii) $>$ (i) $>$ (iv)
(d) (iv) $>$ (iii) $>$ (ii) $>$ (i)
7. IUPAC name of the following compound is,

(a) 1-Chloro-2-isopropylbutane
(b) 3-Chloromethyl-2-methylpentane
(c) 3-Chloromethyl-4-methylpentane
(d) 1-Chloro-2 (1-methylethyl)butane
8. Nucleic acids are the polymers of
(a) Nucleosides
(b) Nucleotides
(c) Bases
(d) Sugars
9. Which of the following statements is not true about glucose ?
(a) It is an aldohexose.
(b) On heating with HI , it forms $n$-hexane.
(c) It is present in furanose form.
(d) It does not give 2, 4-DNP test.
10. Each polypeptide in a protein has amino acids linked with each other in a specific sequence. This sequence of amino acids is said to be.
(a) primary structure of proteins
(b) secondary structure of proteins
(c) tertiary structure of proteins
(d) quaternary structure of proteins
11. Which of the following is more basic than aniline ?
(a) Benzylamine
(b) Diphenylamine
(c) Triphenylamine
(d) $p$-Nitroaniline

For question numbers 12 to 16, two statements are given - one labelled Assertion (A) and the other labelled Reason (R). Select the correct answer to these questions from the codes $(a),(b),(c)$ and $(d)$ as given below :
(a) Both assertion (A) and reason (R) are correct statements, and reason (R) is the correct explanation of the Assertion (A).
(b) Both assertion (A) and reason (R) are correct statements, but reason (R) is not the correct explanation of the assertion (A).
(c) Assertion (A) is correct, but reason (R) is incorrect statement.
(d) Assertion (A) is incorrect, but reason ( R ) is correct statement.
12. Assertion : The molecularity of the reaction $\mathrm{H}_{2}+\mathrm{Br}_{2} \rightarrow 2 \mathrm{HBr}$ appears to be 2 .

Reason : Two molecules of the reactants are involved in the given elementary reaction.
13. Assertion : $\mathrm{F}-\mathrm{F}$ bond in $\mathrm{F}_{2}$ molecule is weak.

Reason : F atom is small in size.
14. Assertion : Nitration of benzoic acid gives meta nitrobenzoic acid.

Reason : Carboxyl group deactivates the ortho and para positions in the ring.
15. Assertion : Carboxylic acids donot give characteristic reactions of carbonyl group.

Reason : The carbonyl group is sterically hindered in carboxylic acid.
16. Assertion : Nitration of chlorobenzene leads to the formation of 1-chloro-4-nitrobenzene as the major product.

Reason: $-\mathrm{NO}_{2}$ group is an $o, p$-directing group.

## SECTION - B

17. Write short notes on
(i) Finkelstein reaction (ii) Sandmeyer reduction

## OR

Write short notes on
(i) Reimer - Tiemann reaction (ii) Rosenmund's reduction.
18. For a $5 \%$ solution of urea (Molar mass $=60 \mathrm{~g} / \mathrm{mol}$ ), calculate the osmotic pressure at $300 \mathrm{~K} .\left[\mathrm{R}=0 \cdot 0821 \mathrm{~L} \mathrm{~atm} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}\right]$ OR
Visha took two aqueous solutions - one containing $7 \cdot 5 \mathrm{~g}$ of urea (Molar mass $=60 \mathrm{~g} / \mathrm{mol}$ ) and the other containing 42.75 g of substance $\mathbf{Z}$ in 100 g of water, respectively. It was observed that both the solutions froze at the same temperature. Calculate the molar mass of $\mathbf{Z}$.
19. Analyse the given graph, drawn between concentration of reactant $v s$. time. $1 \times 2=2$

(a) Predict the order of reaction.
(b) Theoretically, can the concentration of the reactant reduce to zero after infinite time? Explain.
20. Draw the shape of the following molecules :
(a) $\mathrm{XeOF}_{4}$
(b) $\mathrm{BrF}_{3}$
21. Give the formulae of the following compounds :
(a) potassium tetrahydroxidozincate(II)
(b) hexaammineplatinum(IV) chloride
22. What happens when
(a) Propanone is treated with methyl magnesium iodide and then hydrolysed,
(b) Benzene is treated with $\mathrm{CH}_{3} \mathrm{COCl}$ in presence of anhydrous $\mathrm{AlCl}_{3}$ ?
23. The treatment of alkyl chloride with aqueous KOH leads to the formation of alcohols but in the presence of alcoholic KOH , alkenes are major products. Explain.
24. Give the structures of $\mathbf{A}$ and $\mathbf{B}$ in the following sequence of reactions:
(a) $\mathrm{CH}_{3} \mathrm{COOH} \xrightarrow[\Delta]{\mathrm{NH}_{3}} \mathbf{A} \xrightarrow{\mathrm{NaOBr}} \mathbf{B}$
(b) $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NO}_{2} \xrightarrow{\mathrm{Fe} / \mathrm{HCl}} \mathbf{A} \xrightarrow[0^{\circ}-5^{\circ} \mathrm{C}]{\mathrm{NaNO}_{2}+\mathrm{HCl}} \mathbf{B}$

$$
\frac{1}{2} \times 4=2
$$

OR
How will you distinguish between the following pairs of compounds :
$1 \times 2=2$
(i) Aniline and Ethanamine
(ii) Aniline and N -methylaniline
25. Give the plausible explanation for the following :
$1 \times 2=2$
(a) Glucose doesn't give 2, 4-DNP test.
(b) The two strands in DNA are not identical but are complementary.

## SECTION - C

26. Account for the following :
(a) Sulphurous acid is a reducing agent.
(b) Fluorine forms only one oxoacid.
(c) Boiling point of noble gases increases from He to Rn.

Complete the following chemical reactions :
(a) $\mathrm{MnO}_{2}+4 \mathrm{HCl} \longrightarrow$
(b) $\mathrm{XeF}_{6}+\mathrm{KF} \longrightarrow$
(c) $\mathrm{I}^{-}(a q)+\mathrm{H}^{+}(a q)+\mathrm{O}_{2}(g) \longrightarrow$
27. (a) What happens when white phosphorus is heated with conc. NaOH solution in an inert atmosphere of $\mathrm{CO}_{2}$.
(b) Why does $\mathrm{NH}_{3}$ act as a Lewis base.
(c) Though nitrogen exhibits +5 oxidation state, it does not form pentahalides. $1 \times 3=3$
28. An element having $b c c$ geometry has atmoic mass 50. Calculate the density if unit cell edge length is 290 pm .

OR
Analysis shows that nickel oxide has the formula $\mathrm{Ni}_{0.98} \mathrm{O}$. What fraction of nickel exist as $\mathrm{Ni}^{2+}$ and $\mathrm{Ni}^{3+}$ ions ?
29. How will the rate of the reaction be affected when
(a) Surface area of the reactant is reduced,
(b) Catalyst is added in a reversible reaction, and
(c) Temperature of the reaction is increased ?
30. Calculate the mass of ascorbic acid (Molar mass $=176 \mathrm{~g} \mathrm{~mol}^{-1}$ ) to be dissolved in 75 g of acetic acid, to lower its freezing point by $15^{\circ} \mathrm{C}$. $\left(\mathrm{K}_{f}=3.9 \mathrm{~K} \mathrm{~kg} \mathrm{~mol}^{-1}\right)$

## SECTION - D

31. (a) Calculate $\Delta \mathrm{G}^{\circ}$ for the reaction

$$
\begin{equation*}
\mathrm{Zn}(s)+\mathrm{Cu}^{2+}(a q) \longrightarrow \mathrm{Zn}^{2+}(a q)+\mathrm{Cu}(s) \tag{3}
\end{equation*}
$$

Given : $\mathrm{E}^{\circ}$ for $\mathrm{Zn}^{2+} / \mathrm{Zn}=-0.76 \mathrm{~V}$ and $\mathrm{E}^{\circ}$ for $\mathrm{Cu}^{2+} / \mathrm{Cu}=+0.34 \mathrm{~V}, \mathrm{R}=8.314 \mathrm{JK}^{-1} \mathrm{~mol}^{-1}, \mathrm{~F}=96500 \mathrm{C} \mathrm{mol}^{-1}$.
(b) Why does the e.m.f. of a galvanic cell decrease on drawing current from it? When does it falls to zero ?
(a) Out of the following pairs, predict with reason which pair will allow greater conduction of electricity :
(i) Silver wire at $30^{\circ} \mathrm{C}$ or silver wire at $60^{\circ} \mathrm{C}$.
(ii) $0 \cdot 1 \mathrm{M} \mathrm{CH}_{3} \mathrm{COOH}$ solution or $1 \mathrm{M} \mathrm{CH}_{3} \mathrm{COOH}$ solution.
(iii) KCl solution at $20^{\circ} \mathrm{C}$ or KCl solution at $50^{\circ} \mathrm{C}$.
(b) Give two points of differences between galvanic and electrolytic cells.
32. (a) Account for the following :
(i) Copper(I) compounds are white whereas copper(II) compounds are coloured.
(ii) The transition metals and their many compounds act as good catalyst. Explain why.
(iii) $\mathrm{Zn}, \mathrm{Cd}, \mathrm{Hg}$ are considered as $d$-block elements but not as transition elements.
(b) Calculate the spin-only moment of $\mathrm{Co}^{2+}(\mathrm{Z}=27)$ by writing the electronic configuration of Co and $\mathrm{Co}^{2+}$. OR
(a) What is lanthanoid contraction? What are its causes and its consequences?
(b) Give reason and select one atom/ion which will exhibit asked property :
(i) $\mathrm{Sc}^{3+}$ or $\mathrm{Cr}^{3+}$ (Exhibit diamagnetic behaviour)
(ii) Cr or Cu (Higher melting and boiling point)
33. (a) Out of $t$-butyl alcohol and $n$-butanol, which one will undergo acid catalyzed dehydration faster and why ? 2
(b) Carry out the following conversions :
(i) Phenol to Salicylaldehyde
(ii) $t$-Butyl chloride to $t$-Butyl ethyl ether
(iii) Propene to 1-Propanol

## OR

(a) Give the mechanism for the formation of ethanol from ethene.
(b) Predict the reagent for carrying out the following conversions:
(i) Phenol to benzoquinone
(ii) Anisole to $p$-bromoanisole
(iii) Phenol to 2, 4, 6-tribromophenol

## SOLUTION

(i) (b) Explanation : A $1^{\circ}$ alkyl halide prefers to undergo $\mathrm{S}_{\mathrm{N}} 2$ reaction.
(ii) (d) Explanation : All are $3^{\circ}$ alkyl halides but cleavage of C-I lond is the easiest.
(iii) (a) Explanation : This $1^{\circ}$ alkyl halide is expected to take part in $\mathrm{S}_{\mathrm{N}} 2$ reaction. However, it actually participates in $\mathrm{S}_{\mathrm{N}} 1$ reaction since $\mathrm{C}_{6} \mathrm{H}_{5} \stackrel{+}{\mathrm{C}} \mathrm{H}_{2}$ carbocation is resonance stabilised.
(iv) (a) Structure (ii) is achiral. Structure (iii) is chiral but Br atom is not attached to chiral centre. Structure (i) is chiral and Br -atom is attached to chiral centre. It is a $2^{\circ}$ alkyl halide. $\mathrm{By} \mathrm{S}_{\mathrm{N}}{ }^{1}$ mechanism it will give a recemic mixture.

OR
(c) Explanation : Iodide ion $\left(\mathrm{I}^{-}\right)$will get attached to smaller alkyl group to minimise steric hinderance.
2. (i) (a) Reason is the correct explanation for assertion
(ii) (d) Correct assertion : When raw sugar solution is passed over beds of animal charcoal, the colouring substances are adsorbed by the charcoal.
(iii) (c) Correct reason : Powdered charocoal adsorbs ammonia.
(iv) (a) Reason is the correct explanation for assertion.
(b) Correct explanation : Powdered charcoal adsorbs $\mathrm{SO}_{2}$.
3. (b) Explanation : $\left[\mathrm{Co}\left(\mathrm{NH}_{5}\right)\right] \mathrm{Cl}_{2}(a q) \rightarrow\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{Cl}\right]^{2+}(a q)+2 \mathrm{Cl}^{-}(a q)$
4. (c) Explanation: $\Delta_{\mathrm{o}} \propto \frac{1}{\lambda_{\text {max }}}$

Hence the correct order of $\Delta_{\mathrm{o}_{m}}$ for the ions is, $\left[\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{3+}<\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{6}\right]^{3+}<\left[\mathrm{Co}(\mathrm{CN})_{6}\right]^{3-}$
5. (c) Explanation : $\mu=\sqrt{n(n+2)}$

Here $\mu=2.83$ (given)
$\therefore 2 \cdot 83=\sqrt{n(n+2)}$
The solution for this equation is $n=2$ (nearest whole number) with $3 d^{8}$-configuration, number of unpaired electrons in $\mathrm{Ni}^{2+}$ ion is two.
6. (c) Explanation : This order of reactivity in $\mathrm{S}_{\mathrm{N}} 1$ reactions is directly proportional to the relative stabilities of carbocations which is tertiary $>$ secondary $>$ primary
$\therefore \quad$ The correct order of reactivity is :

$$
\text { III }>\text { II }>\text { I }>\text { IV }
$$

## 7. (b) Explanation :

IUPAC name : 3-Chloromethyl-2-methylpentane.
8. (b) Explanation : Nucleic acids are the polymers of nucleotides
9. (c) Explanation : Glucose is not present is the furanose form
10. (a) Explanation : The sequence of amino acids in protein is called its primary structure.
11. (a) Explanation : Benzylamine is more basic than aniline. This is because benzene ring does not exert any conjugation effect in benzylamine. In all other amines the effect operates.

12. (a) Reason is the correct explanation for assertion.
13. (b) Correct explanation : It is due to strong inter-electronic repulsions between the lone pairs of electrons on the two fluorine atoms.
14. (a) Reason is the correct explanation for assertion.
15. (c) Correct reason : It is due to the absence of positive charge on the carbon atoms of -COOH group in its resonating structure.
16. (c) Correct reason : Chloro group is $o-, p$-directing and ortho position is sterically hindered to some extent.
17. (i) Finkelstein reaction. An alkyl iodide may be prepared by treating an alkyl chloride or bromide with sodium iodide in acetone. The chlorine or bromine atom of the alkyl halide is replaced by iodine atom in the reaction.

(iii) Sandmeyer Reaction. Introduction of chlorine or bromine into benzene ring by treating the diazonium salt solution with cuprous chloride (or cuprous bromide) to get chlorobenzene (or bromobenzene) is called Sandmeyer's reaction.

OR
(i) Reimer Tiemann Reaction. Treatment of phenol with chloroform in the presence of aqueous alkali at 340 K results in the formation of $o$-hydroxybenzaldehyde (salicyaldehyde) and $p$-hydroxybenzaldehyde, the ortho isomer being the major product.

If carbon tetrachloride is used in place of chloroform, $o$-hydroxybenzoic acid (salicylic acid) is obtained as the major product.

(ii) Rosenmund's Reduction : This reaction involves the heating of an acid chloride with $\mathrm{H}_{2}$ in the presence of Pd deposited over $\mathrm{BaSO}_{4}$ poisoned with S or quinoline.

Benzoyl chloride
Benzaldehyde
This method can be used to make both aliphatic and aromatic aldehydes.
18. $w_{\mathrm{B}}=5 \mathrm{~g}, \mathrm{M}_{\mathrm{B}}=60 \mathrm{~g} \mathrm{~mol}^{-1}, \mathrm{~T}=300 \mathrm{~K}, \mathrm{~V}=100 \mathrm{~mL}=0 \cdot 1 \mathrm{~L}$ (Take density of solution as $1 \mathrm{~g} \mathrm{~mL}^{-1}$ ), $\mathrm{R}=0.0821 \mathrm{~L}$ atm $\mathrm{K}^{-1} \mathrm{~mol}^{-1}, \pi=$ ?

$$
\begin{aligned}
\pi & =\frac{n}{\mathrm{~V}} \mathrm{RT}=\frac{w_{\mathrm{B}}}{\mathrm{M}_{\mathrm{B}}} \times \frac{\mathrm{RT}}{\mathrm{~V}} \\
& =\frac{5 g}{60 \mathrm{~g} \mathrm{~mol}^{-1}} \times \frac{\left(0 \cdot 0821 \mathrm{Latm} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}\right) \times 300 \mathrm{~K}}{0 \cdot 1 \mathrm{~L}}=\mathbf{2 0 . 5} \mathbf{~ a t m}
\end{aligned}
$$

OR
For solution of urea

$$
w_{\text {urea }}=7 \cdot 5 \mathrm{~g}, \mathrm{M}_{\text {urea }}=60 \mathrm{~g} \mathrm{~mol}^{-1}, w_{\mathrm{A}}=100 \mathrm{~g}=0 \cdot 1 \mathrm{~kg}
$$

For solution of $\mathbf{Z}$

$$
\begin{aligned}
w_{z} & =42.75 \mathrm{~g}, \mathrm{M}_{z}=?, w_{\mathrm{A}}=100 \mathrm{~g}=0 \cdot 1 \mathrm{~kg} \\
\mathrm{~K}_{f} \times \frac{w_{\text {urea }}}{\mathrm{M}_{\text {urea }}} \times \frac{1}{\mathrm{~W}_{\mathrm{A}}(\mathrm{~kg})} & =\mathrm{K}_{f} \times \frac{w_{z}}{\mathrm{M}_{z}} \times \frac{1}{w_{\mathrm{A}}(\mathrm{~kg})} \\
\frac{7.5 \mathrm{~g}}{60 \mathrm{~g} \mathrm{~mol}^{-1}} \times \frac{1}{0 \cdot 1 \mathrm{~kg}} & =\frac{42.75 \mathrm{~g}}{\mathrm{M}_{z}} \times \frac{1}{0.1 \mathrm{~kg}} \\
\mathrm{M}_{z} & =\frac{42.75 \mathrm{~g}}{7 \cdot 5 \mathrm{~g}} \times 60 \mathrm{~g} \mathrm{~mol}^{-1}=\mathbf{3 4 2} \mathbf{g ~ m o l}^{-1}
\end{aligned}
$$

19. (a) In first 10 min . concentration of reactant reduces from 1.6 M to 0.8 M i.e., it becomes half. In next 10 min . concentration of reactant reduces from 0.8 M to 0.4 M i.e., it becomes half. In next 10 min . concentration of reactant reduces from 0.4 M to 0.2 M i.e., it becomes half. Thus half life period is independent of intial concentration. Hence it is a first order reaction.
(b) Theoretically, for a first order reaction, the concentration of reactant will never reduce to zero even after infinite time.

OR
Due to exponential relation, the curve never touches the $x$-axis and hence concentration of reactant will never hecome zero.
20. (a)

$\mathrm{XeOF}_{4}$

$\mathrm{BrF}_{3}$
(b) $\left[\mathrm{Pt}\left(\mathrm{NH}_{3}\right)_{6}\right] \mathrm{Cl}_{4}$
hexaamineplatinum(IV) chloride
21. (a) $\mathrm{K}_{2}\left[\mathrm{Zn}(\mathrm{OH})_{4}\right]$ potassium tetrahydroxidozincate(II)
22. (a)

23. KOH when dissolved in water provides $\mathrm{K}^{+}$and $\mathrm{OH}^{-}$ions.

$$
\mathrm{KOH}+a q \rightleftharpoons \mathrm{~K}^{+}(a q)+\mathrm{OH}^{-}(a q)
$$

These $\mathrm{OH}^{-}$ions act as strong nucleophiles leading to nucleophilic substitution $\left(\mathrm{S}_{\mathrm{N}}{ }^{1}\right.$ or $\left.\mathrm{S}_{\mathrm{N}}{ }^{2}\right)$.
KOH when dissolved in alcohol (say ethanol) gives ethoxide ions and $\mathrm{K}^{+}$ions.

$$
\mathrm{KOH}+\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH} \rightleftharpoons \mathrm{C}_{2} \mathrm{H}_{5} \mathrm{O}^{-} \mathrm{K}^{+}+\mathrm{H}_{2} \mathrm{O}
$$

The bulkier nucleophile (alkoxide ion) in this case will prefer to act as a base and abstract a proton rather than approach a tetravalent carbon atom (steric reasons). However, the exact nature of products formed also depends upon the nature of alkyl halide used. The ease of elimination follows the order :

$$
1^{\circ}<2^{\circ}<3^{\circ}
$$

Therefore, in case of a $3^{\circ}$ alkyl halide, alkene is the major product even with $a q$. KOH . However in case of $1^{\circ}$ alkyl halides almost pure alcohols (with $a q . \mathrm{KOH}$ ) and almost pure alkenes (with alc. KOH ) can be obtained.
24. (a)

(A)
(B)
(b) $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NO}_{2} \xrightarrow{\mathrm{Fe} / \mathrm{HCl}} \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2} \xrightarrow[0^{\circ}-5^{\circ} \mathrm{C}]{\mathrm{NaNO}_{2}+\mathrm{HCl}} \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{~N}_{2} \mathrm{Cl}$
(A)
(B)

OR
(i) Add ice cold $\left(\mathrm{NaNO}_{2}+\mathrm{HCl}\right)$ followed by phenol to both the compounds. Only aniline forms a orange dye.
(ii) Add $\mathrm{CHCl}_{3}$ and KOH (alc.) to both the compounds and heat. Only aniline gives foul smelling isocyanide.
25. (a) In glucose the - CHO group is not free as it is involved in the formation of hemiacetal in the cyclic structure. Hence glucose does not give 2, 4-DNP test (a test for carbonyl group).
(b) This is because, the hydrogen bonds are formed between specific pairs of bases ( $\mathrm{A}=\mathrm{T}$ and $\mathrm{C} \equiv \mathrm{G}$ )
26. (a) In sulplurous acid $\left(\mathrm{H}_{2} \mathrm{SO}_{3}\right) \mathrm{O}$.S. of sulphur is +4 . Because sulphur readily gets oxidised itself to more stable +6 oxiation state, hence $\mathrm{H}_{2} \mathrm{SO}_{3}$ acts as a reducing agent.
(b) Because of absence of $d$-orbitals in fluorine, it forms and one oxo acid (HOF).
(c) As the number of electrons increases from He to Rn the magnitude of London dispersion forces also increases down the group. It results in increase in boiling point from He to Rn .

OR
(a) $\mathrm{MnO}_{2}+2 \mathrm{HCl} \rightarrow \mathrm{MnCl}_{2}+\mathrm{H}_{2} \mathrm{O}+[\mathrm{O}]$
$2 \mathrm{HCl}+[\mathrm{O}] \rightarrow \mathrm{H}_{2} \mathrm{O}+\mathrm{Cl}_{2}$
$\mathrm{MnO}_{2}+4 \mathrm{HCl} \rightarrow \mathrm{MnCl}_{2}+2 \mathrm{H}_{2} \mathrm{O}+\mathrm{Cl}_{2}$
(b) $\mathrm{XeF}_{6}+\mathrm{KF} \rightarrow \mathrm{K}^{+}\left[\mathrm{XeF}_{7}\right]^{-}$
(c) $4 \mathrm{I}^{-}(a q)+4 \mathrm{H}^{+}(a q)+\mathrm{O}_{2}(g) \rightarrow 2 \mathrm{I}_{2}(s)+2 \mathrm{H}_{2} \mathrm{O}(l)$
27. (a) $\mathrm{P}_{4}+3 \mathrm{NaOH}+3 \mathrm{H}_{2} \mathrm{O} \xrightarrow{\Delta} \mathrm{PH}_{3}+3 \mathrm{NaH}_{2} \mathrm{PO}_{2}$

White phosphorus Sod. hypophosphite
(b) It is due to the presence of lone pair of electrons on nitrogen atom in ammonia.
(c) Due to the absence of $d$-orbitals in its valence shell, nitrogen cannot expand its covalency beyond four.
28. $a=290 \mathrm{pm}=290 \times 10^{-10} \mathrm{~cm}=2.9 \times 10^{-8} \mathrm{~cm}$
$\mathrm{M}=50 \mathrm{~g} \mathrm{~mol}^{-1}, z=2$ (for $b c c$ unit cell), $\mathrm{N}_{\mathrm{A}}=6.022 \times 10^{23} \mathrm{~mol}^{-1}$

$$
\text { Density, } \begin{aligned}
& d=\frac{z \times \mathrm{M}}{a^{3} \times \mathrm{N}_{\mathrm{A}}}=\frac{2 \times\left(50 \mathrm{~g} \mathrm{~mol}^{-1}\right)}{\left(2.9 \times 10^{-8} \mathrm{~cm}\right)^{3} \times\left(6.022 \times 10^{23} \mathrm{~mol}^{-1}\right)} \\
&=\frac{100}{(2.9)^{3} \times 10^{-24+23} \times 6.022} \mathrm{~g} / \mathrm{cm}^{3}=\frac{1000}{(2.9)^{3} \times 6.022} \mathrm{~g} / \mathrm{cm}^{3} \\
&=\frac{1000}{24.389 \times 6.022} \mathrm{~g} / \mathrm{cm}^{3}=\frac{1000}{16.87} \mathrm{~g} / \mathrm{cm}^{3}=\mathbf{6 . 8} \mathbf{~ g} / \mathrm{cm}^{3} \\
& \boldsymbol{O R}
\end{aligned}
$$

In the given nickel oxide 98 Ni atoms are associated with 100 O -atoms. Out of 98 Ni atoms, suppose Ni present as $\mathrm{Ni}^{2+}=x$. Then Ni present as $\mathrm{Ni}^{3+}=98-x$.
Total charge on $x \mathrm{Ni}^{2+}$ and $(98-x) \mathrm{Ni}^{3+}$ should be equal to charge on $100 \mathrm{O}^{2-}$ ions. Hence,

$$
\begin{aligned}
x \times 2+(98-x) \times 3 & =100 \times 2 \\
2 x+294-3 x & =200 \quad \text { or } \quad x=94
\end{aligned}
$$

$\therefore \quad$ Fraction of Ni present as $\mathrm{Ni}^{2+}=\frac{94}{98} \times 100=\mathbf{9 6 \%}$
Fraction of Ni present as $\mathrm{Ni}^{3+}=\frac{4}{98} \times 100=\mathbf{4 \%}$.
29. (a) On reducing surface area of reactant, the rate of the reaction decreases.
(b) On adding a positive catalyst to a reversible reaction, the time taken to reach equilibrium is reduced. It is due to increase in the rate of both foward and backward reactions. However, there will not be any change in the position of equilibrium.
(c) On increasing the temperature, the rate of a chemical reaction also increases.
30. $w_{\mathrm{B}}=? \mathrm{M}_{\mathrm{B}}=176 \mathrm{~g} \mathrm{~mol}^{-1}, w_{\mathrm{A}}=75 \mathrm{~g}=0.075 \mathrm{~kg}$,

$$
\begin{aligned}
\mathrm{K}_{f} & =3.9 \mathrm{~K} \mathrm{~kg} \mathrm{~mol} \\
-1 & \Delta \mathrm{~T}_{f}=15^{\circ} \mathrm{C}=15 \mathrm{~K} \\
\Delta \mathrm{~T}_{f} & =\mathrm{K}_{f} \times \frac{w_{\mathrm{B}}}{\mathrm{M}_{\mathrm{B}}} \times \frac{1}{w_{\mathrm{A}}(\mathrm{~kg})} \\
w_{\mathrm{B}} & =\frac{\Delta \mathrm{T}_{f} \times \mathrm{M}_{\mathrm{B}} \times w_{A}(\mathrm{~kg})}{\mathrm{K}_{f}} \\
& =\frac{15 \mathrm{~K} \times\left(176 \mathrm{~g} \mathrm{~mol}^{-1}\right) \times(0.075 \mathrm{~kg})}{3.9 \mathrm{~K} \mathrm{~kg} \mathrm{~mol}^{-1}}=\mathbf{5 . 0 8 g}
\end{aligned}
$$

31. (a) For the reaction
$\mathrm{Zn}(s)+\mathrm{Cu}^{2+}(a q) \rightarrow \mathrm{Zn}^{2+}(a q)+\mathrm{Cu}(\mathrm{s})$
$n=2$
Cell representation is, $\quad \mathrm{Zn}\left|\mathrm{Zn}^{2+}(1 \mathrm{~mol}) \| \mathrm{Cu}^{2+}(1 \mathrm{~mol})\right| \mathrm{Cu}$

$$
\begin{aligned}
\therefore \quad \mathrm{E}^{\circ}{ }_{\text {cell }} & =\mathrm{E}_{\mathrm{Cu}^{2+} / \mathrm{Cu}}^{\circ}-\mathrm{E}_{\mathrm{Zn}^{2+} / \mathrm{Zn}} \\
& =+0 \cdot 34 \mathrm{~V}-(-0 \cdot 76 \mathrm{~V})=1 \cdot 10 \mathrm{~V} \\
\mathrm{~F} & =96500 \mathrm{C} \mathrm{~mol}^{-1}, \Delta \mathrm{G}^{\circ}=? \\
\Delta \mathrm{G}^{\circ} & =-n \mathrm{E}^{\circ} \mathrm{F} \\
& =-2 \times(1 \cdot 10 \mathrm{~V}) \times\left(96500 \mathrm{C} \mathrm{~mol}^{-1}\right) \\
& =-212300 \mathrm{~J} \mathrm{~mol}^{-1}=\mathbf{- 2 1 2 . 3} \mathbf{~ k J ~ m o l}^{\mathbf{- 1}}
\end{aligned}
$$

(b) In a galvanic cell, electrons flow from the electrode at a lower reduction potential (i.e., anode) to an electrode at a higher reduction potential (i.e., cathode). When the current is drawn from a cell, the concentration of cations in the oxidation half cell (i.e., anode) increases while the concentration of cations in the reduction half cell (i.e., cathode) decreases. As the reduction potential is directly proportional to the concentration of ions in solution, the reduction potential of anode start increasing, wheras reduction potential of cathode start decreasing. As e.m.f. of cell is given by the expression,

$$
\mathrm{E}_{\text {cell }}=\mathrm{E}_{\text {cathode }}-\mathrm{E}_{\text {anode }}
$$

e.m.f. of the cell gradually decreases with time. Ultimately a stage is reached when the $\mathrm{E}_{\text {cathode }}$ and $\mathrm{E}_{\text {anode }}$ becomes equal and cell stops working. OR
(a) (i) Silver wire at $30^{\circ} \mathrm{C}$ because as temperature decreases, resistance decreases so conductance

Decrease in the e.m.f. of the cell with the progress of the reaction. increases.
(ii) $0 \cdot 1 \mathrm{M} \mathrm{CH}_{3} \mathrm{COOH}$, because on dilution degree of ionisation increases and hence conduction (molar conductivity) increases.
(iii) KCl solution at $50^{\circ} \mathrm{C}$, because at high temperature mobility of ions increases and hence conductance increases.
(b)

| S.No. | Galvanic cell | Electrolytic cell |
| :---: | :--- | :--- |
| 1. | The redox reaction is spontaneous. | The redox reaction is non-spontaneous. |
| 2. | Electricity is produced | Electricity is consumed. |
| 3. | Anode is $-v e$ and cathode is + ve. | Anode is + ve and cathode is $-v e$. |
| 4. | The electrodes are generally of different. | The electrodes may be of same of different |
|  | materials | material. |
| 5. | Two different electrolytes are used. | One electrolyte is used. |

32. (a) (i) $\mathrm{Cu}^{+}\left(3 d^{10}\right)$ compounds are white because of absence of unpaired electrons while $\mathrm{Cu}^{2+}\left(3 d^{9}\right)$ compounds are coloured due to the presence of unpaired electron.
(ii) Many transition metals and their compounds are found to act as catalyst. Because of the presence of the incomplete $d$-subshell, they can form unstable intermediate products with the reactants. These intermediates give reaction path of lower activation energy and therefore increase the rate of reaction.

## For example :

(i) Finally divided nickel, platinum and palladium are used as a catalyst in hydrogenation.
(ii) $\mathrm{V}_{2} \mathrm{O}_{5}$ is used for the oxidation of $\mathrm{SO}_{2}$ to $\mathrm{SO}_{3}$ in the Contact process for the manufacture of $\mathrm{H}_{2} \mathrm{SO}_{4}$.
(iii) Iron and molybdenum are used as catalyst in the manufacture of ammonia from $\mathrm{N}_{2}$ and $\mathrm{H}_{2}$ in Haber's process.
(iii) $\mathrm{Zn}, \mathrm{Cd}$ and Hg are considered as $d$-block elements because their last electron enters the $d$-subshell of penultimate shell. As these elements and none of their oxidation states have partly filled $d$-subshell, they are not considered as transition elements
(b) $\mathrm{Co}[\mathrm{Z}=27]:[\mathrm{Ar}]^{18} 4 s^{2} 3 d^{7} \quad \mathrm{Co}^{2+}:[\mathrm{Ar}]^{18} 3 d^{7}$

Hence number of unpaired eletrons, $n=3$

$$
\begin{aligned}
\therefore \quad \mu_{\text {spin only }} & =\sqrt{n(n+2)} \\
& =\sqrt{2(3+2)}=\sqrt{15}=\mathbf{3 . 9 2} \mathbf{~ B . M . ~}
\end{aligned}
$$

## OR

(a) Lanthanoid contraction. In lanthanoids there is a regular decrease in the size of atoms and ions with increasing atomic number. Lanthanoid contraction may be defined as the steady decrease in the size of lanthanoid ions $\left(\mathrm{Ln}^{3+}\right)$ with the increase in atomic number. Due to lanthanoid contraction ionic radii decrease from $\mathrm{Ce}^{3+}(111 \mathrm{pm})$ to $\mathrm{Lu}^{3+}(93 \mathrm{pm})$.
Cause of Lanthanoid contraction. As we move through the lanthanoid series, $4 f$-electrons are being added one at each step. The mutual shielding effect of $4 f$-electrons is very little. This is due to the shape of $f$-orbitals, as they are much diffused. The nuclear charge however, increases by one at each step. Hence, the inward pull experienced by the $4 f$-electrons increases. The causes a
reduction in the size of entire $4 f^{n}$ subshell. The sum of successive reductions give the total lanthanoid contraction. The decrease in atomic size is not so regular, it is more in case of first six elements. However, the decrease in ionic size of tripositive ion $\mathrm{M}^{3+}$ with atomic number is quite regular along the series.

## Consequences of lanthanoid contraction.

1. Lanthanoid contraction is an important factor in allowing the separation of lanthanoids from one another as they resemble each other chemically. The separation is done by ion exchange methods.

2. Due to lanthanoid contraction, elements of $4 d$ and $5 d$-series have similar atomic radii $e . g ., \mathrm{Zr}=145 \mathrm{pm}$ and $\mathrm{Hf}=144 \mathrm{pm}$. Thus Zr and Hf have almost identical physical and chemical properties.
3. Due to lanthanoid contraction basic strength of oxides and hydroxide decreases along the series.
4. There is a small but steady increase in the standard reduction potential $\left(\mathrm{E}^{\circ}\right)$ for the process ;
$\mathrm{M}^{3+}(a q)+3 e^{-} \longrightarrow \mathrm{M}(s)$
5. Due to lanthanoid contraction elements of the second and third transition series resembles each other more closely than to the elements of 1 st and 2 nd transition series.
(b) (i) Out of $\mathrm{Sc}^{3+}\left(3 d^{0}\right)$ and $\mathrm{Cr}^{3+}\left(3 d^{3}\right), \mathrm{Sc}^{3+}$ is diamagnetic. It is due to the absence of any upaired $d$-electron.
(ii) Out of $\mathrm{Cr}\left(4 s^{1} 3 d^{5}\right)$ or $\mathrm{Cu}\left(4 s^{1} 3 d^{10}\right)$, Cr has higher melting and boiling points. It is due to the presence of large number of unpaired $d$-electrons in Cr which result in strong interatomic bonding.
6. (a) tert-Butyl alcohol

Reason : Acid catalysed dehydration of alcohol involves the formation of a carbocation as an intermediate and $3^{\circ}$ carbocation is more stable than a $1^{\circ}$ carbocation.
(b)
(i)

Salicylaldehyde
(ii)

(a) It involves following three steps

Step 1. Protonation of alkene to form carbocation by electrophilic attack of $\mathrm{H}_{3} \mathrm{O}^{+}$.
$\mathrm{H}_{2} \mathrm{O}+\mathrm{H}^{+} \rightarrow \mathrm{H}_{3} \mathrm{O}^{+}$

Step 2. Nucleophilic attack of water on carbocation.

Step 3. Deprotonation to form an alcohol.

(b)
(i)

Reagent used: $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7} / \mathrm{H}_{2} \mathrm{SO}_{4}$
(ii)

Reagent used : $\mathrm{Br}_{2}$ in ethanoic acid $\left(\mathrm{CH}_{3} \mathrm{COOH}\right)$

Regent used : Bromine water or $\mathrm{Br}_{2}(a q)$

# Sample Question Paper-4 

Chemistry (Theory)-XII
Time Allowed : 3 Hours
Maximum Marks : 70
General Instructions : Same as in Sample Paper-1

## SECTION - A (Objective Type)

## 1. Read the following and answer the questions (i) to (iv) that follows :

Both alcohols and phenols contain a hydroxyl group, but phenols are more acidic than alcohols. The reason being that the phenoxide ion left after the removal of a proton is resonance stabilized while alkoxide is not. However, both are weaker acids than carbonic acid and hence do not decompose aqueous $\mathrm{NaHCO}_{3}$ solution evolving $\mathrm{CO}_{2}$. The presence of electron-donating groups in the benzene ring decrease the acid strength while the presence of electron withdrawing groups in the benzene ring increase the acid strength of phenols. The relative strength of $\theta, m$ and $p$ substituted phenols however, depends upon a combination of inductive and resoanance effects of the substituent.
Alcohols are very weak acids even weaker than water. Because of the +1 effect of the alkyl groups, the acid strength of alcohols decreases in the order : $1^{\circ}$ alcohol $>2^{\circ}$ alcohol $>3^{\circ}$ alcohol.
(i) Which of the following is the strongest acid ?
(a) $\mathrm{CH}_{3} \mathrm{CHF} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}$
(b) $\mathrm{FCH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}$
(c) $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CHFCH}_{2} \mathrm{OH}$
(d) $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CF}_{2} \mathrm{CH}_{2} \mathrm{OH}$
(ii) The acidic strength decreases in the order
(a) $p$-Nitrophenol $>m$-Nitrophenol $>o$-Nitrophenol
(b) $p$-Nitrophenol $>o$-Nitrophenol $>m$-Nitrophenol
(c) $m$-Nitrophenol $>o$-Nitrophenol $>p$-Nitrophenol
(d) $o$-Nitrophenol $>m$-Nitrophenol $>p$-Nitrophenol
(iii) Which of the following is the strongest acid?
(a) Phenol
(b) 2-Nitrophenol
(c) 2, 4-Dinitrophenol
(d) 2, 4, 6- Trinitrophenol

## OR

The acidic strength decreases in the order
(a) $o$-Chlorophenol $>m$-Chlorophenol $>p$-Chlorophenol
(b) $o$-Chlorophenol $>p$-Chlorophenol $>m$-Chlorophenol
(c) $p$-Chlorophenol $>o$-Chlorophenol $>m$-Chlorophenol
(d) $p$-Chlorophenol $>m$-Chlorophenol $>o$-Chlorophenol
(iv) Which of the following is the strongest acid?
(a) Phenol
(b) $o$-Cresol
(c) $m$-Cresol
(d) $p$-Cresol.
2. Read the following and answer the questions (i) to (iv) that follows :

There are certain substances which behave as normal strong electrolytes at low concentration but at higher concentration they behave as colloidal solutions due to the formation of aggregated particles. Such colloids are called associated colloids and the aggregaed particles are called micelles. Soaps and detergents are the examples of associated colloids. The formation of micelles takes place above certain concentration called critical micellization concentration (CMC) and a characteristic temperature called Kraft temperature.
The questions given below consist of Assertion and Reason. Use the following keys to select the correct answer.
(a) If both assertion and reason are correct and reason is correct explanation for assertion.
(b) If both assertion and reason are correct but reason is not correct explanation for assertion.
(c) If assertion is correct but reason is incorrect.
(d) If assertion is wrong but reason is correct.
(i) Assertion : A mixture of a synthetic detergent in water above a certain concentration and temperature behaves as a colloidol sol. Reason : Synthetic detergents are associated colloids.
(ii) Assertion : A gold sol in water when sufficiently diluted can easily pass through an ultrafilter paper.

Reason : A gold sol in a multimolecular colloid.
(iii) Assertion : A colloidal solution of soap in water, when sufficiently diluted can easily pass through ultrafilter paper.

Reason : Soap is an example of multimolecular colloid.
(iv) Assertion : A colloidal solution of a detergent when sufficiently diluted becames a true solution.

Reason : On dilution the micelles present break upto give ions with size less than 1 nm .
OR
Assertion : A mixture of soap in water above a certain concentration and temperature behaves as a colloidal solution.
Reason : Soap is generally a sodium or potassium salt of a fatty acid.
Following questions (Q.No. 3 to Q.No. 11) are multiple choice questions carrying 1 mark each.
3. Out of the following, the strongest base in aqueous solution is ;
(a) Methylamine
(b) Dimethylamine
(c) Trimethylamine
(d) Aniline

OR
Iodoform test is not given by
(a) Ethanol
(b) Ethanal
(c) Pentan-2-one
(d) Pentan-3-one
4. Out of the following transition elements, the maximum number of oxidation states are shown by
(a) $\mathrm{Sc}(\mathrm{Z}=21)$
(b) $\mathrm{Cr}(\mathrm{Z}=24)$
(c) $\mathrm{Mn}(\mathrm{Z}=25)$
(d) $\mathrm{Fe}(\mathrm{Z}=26)$
5. What is the correct IUPAC name of the given compound ?

(a) 2, 2-Dimethylbutanoic acid
(b) 2-Carboxy1-2-methylbutane
(c) 2-Ethy-2-methylpropanoic acid
(d) 3-Methylbutanecarboxylic acid

OR
The correct IUPAC name of

(a) tert-Butyl alcohol
(b) 2, 2-Dimethylpropan-1-ol
(c) 2-Methylbutan-2-ol
(d) 3-Methylbutane-3-ol
6. The incorrect statement about interstitial compounds is:
(a) They are chemically reactive.
(b) They are very hard
(c) They retain metallic conductivity
(d) They have high melting point.
OR

Total number of unpaired electrons present in $\mathrm{Co}^{3+}$ (Atomic number $=27$ ) is
(a) 4
(b) 7
(c) 6
(d) 3
7. The IUPAC name of the compound shown below is :

(a) 2-Bromo-6-Chlorocyclohex-1-ene
(b) 6-Bromo-2-Chlorocyclohex-1-ene
(c) 3-Bromo-1-chlorocyclohex-1-ene
(d) 1-Bromo-3-Chlorocyclohex-1-ene
8. Among the following the correct order of acidity is :
(a) $\mathrm{HClO}_{2}<\mathrm{HClO}<\mathrm{HClO}_{3}<\mathrm{HClO}_{4}$
(b) $\mathrm{HClO}_{4}<\mathrm{HClO}_{2}<\mathrm{HClO}<\mathrm{HClO}_{3}$
(c) $\mathrm{HClO}_{3}<\mathrm{HClO}_{4}<\mathrm{HClO}_{2}<\mathrm{HClO}$
(d) $\mathrm{HClO}<\mathrm{HClO}_{2}<\mathrm{HClO}_{3}<\mathrm{HClO}_{4}$

OR
Least volatile hydrogen halide is;
(a) HF
(b) HCl
(c) HBr
(d) HI
9. Which of the following compounds will give butanone on oxidation with alkaline $\mathrm{KMnO}_{4}$ solution ?
(a) Butan-1-ol
(b) Butan-2-ol
(c) Both of these
(d) None of these
10. Which of the following is most acidic ?
(a) Benzyl alcohol
(b) Cyclohexanol
(c) Phenol
(d) m-Chlorophenol
11. The oxidation number of chromium in $\left[\mathrm{Cr}\left(\mathrm{NH}_{3}\right)_{4} \mathrm{Cl}_{2}\right]^{+}$is
(a) +2
(b) +3
(c) +4
(d) +5

For question numbers 12 to 16, two statements are given - one labelled Assertion (A) and the other labelled Reason (R). Select the correct answer to these questions from the codes $(a),(b),(c)$ and $(d)$ as given below :
(a) Both assertion (A) and reason (R) are correct statements, and reason (R) is the correct explanation of the Assertion (A).
(b) Both assertion (A) and reason (R) are correct statements, but reason (R) is not the correct explanation of the assertion (A).
(c) Assertion (A) is correct, but reason (R) is incorrect statement.
(d) Assertion (A) is incorrect, but reason (R) is correct statement.
12. Assertion (A) : Boiling points of alkyl halides decrease in the order

$$
\mathrm{R}-\mathrm{I}>\mathrm{R}-\mathrm{Br}>\mathrm{R}-\mathrm{Cl}>\mathrm{R}-\mathrm{F}
$$

Reason (R): van der Waals forces decrease with increase in the size of halogen atom.
13. Assertion (A) : Low spin tetrahedral complexes are rarely observed.

Reason (R): The orbital splitting energies are not sufficiently large to force pairing.
14. Assertion (A) : Albumin is a globular protein.

Reason (R): Polypeptide chain coils around to give a straight chain.
15. Assertion (A) : o-Nitrophenol is a weaker acid than $p$-nitrophenol.

Reason (R) : Intramolecular hydrogen bonding makes ortho isomer weaker than para isomer.
16. Assertion (A) : Carbylamine reaction is applicable only to primary aliphatic amires.

Reason (R) : In carbylamine reaction, the $-\mathrm{NH}_{2}$ group is converted into $-\mathrm{N} \supseteq$ C group.

## OR

Assertion (A) : $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$ is a weaker base than phenol but a stronger nucleophile than phenol.
Reason (R): In phenol, the lone pair of electrons on oxygen is withdrawn towards the ring due to resonance.

## SECTION - B

17. Write short notes on
(i) Connizzaro's reaction (ii) Wolf-Kishner reduction

## OR

Write short notes on
(i) Clemmenson reduction (ii) HVZ reaction
18. Give reasons for the following :
(a) Bond angle C in alcohol is slightly less than the tetrahedral angle.
(b) $\mathrm{C}-\mathrm{OH}$ bond length in $\mathrm{CH}_{3} \mathrm{OH}$ is slightly more than the $\mathrm{C}-\mathrm{OH}$ bond length in phenol.
19. Explain why
(i) Transition metals forms a large number of alloys.
(ii) Transition metals have a tendency to form complexes.
20. What are the conditions and consequences o Schottky defect?

OR
Write short note on F-centres.
21. A reaction is first order w.r.t. reactant $A$ as well as w.r.t. reactant $B$. Give the rate law. Also give one point of difference between average rate and instantaneous rate.
22. For an electrochemical cell

$$
\mathrm{Mg}(s)+2 \mathrm{Ag}^{+}(a q) \longrightarrow 2 \mathrm{Ag}(s)+\mathrm{Mg}^{2+}(a q)
$$

give the cell representation. Also write the Nernst equation for the above cell at $25^{\circ} \mathrm{C}$.
23. Sodium crystallizes in a bcc unit cell. Calculate the approximate no. of unit cells in $9 \cdot 2$ grams of sodium. (Atomic mass of $\mathrm{Na}=23 \mathrm{u}$ ).
24. Why haloarenes are less reactive than haloalkanes towards nucleophilic substitution reactions.

OR
Haloalkanes react with KCN (alc) to give alkyl cyanide as main product while with $\mathrm{AgCN}($ alc) they form isocyanides as the main product. Why?
25. Account for the following :

$$
1 \times 3=3
$$

(a) Aniline is a weaker base compared to ethanamine.
(b) Aniline does not undergo Friedel-Crafts reaction.

## SECTION - C

26. Justify and arrange the following compounds of each set in increasing order of reactivity towards the asked displacement :

$$
1 \frac{1}{2} \times 2=3
$$

(a) 1-Bromobutane, 2-Bromobutane, 2-Bromo-2-methylpropane ( $\mathrm{S}_{\mathrm{N}^{1}}$ reaction)
(b) 1-Bromobutane, 2-Bromobutane, 2-Bromo-2-methylpropane ( $\mathrm{S}_{\mathrm{N}^{2}}$ reaction)
27. (a) Give the IUPAC name and electronic configuration of central metal atom in terms of $t_{2 g}$ and $e_{g}$ of $\mathrm{K}_{4}\left[\mathrm{Mn}(\mathrm{CN})_{6}\right]$.
(b) What is meant by 'Chelate effect' ? Give an example.

OR
Write the hybridisation and magnetic characters of the following complexes :
(i) $\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]^{4-}$
(ii) $\left[\mathrm{CoF}_{6}\right]^{3-}$
(iii) $\left[\mathrm{Ni}(\mathrm{CO})_{4}\right]$
[Atomic number : $\mathrm{Fe}=26, \mathrm{Co}=27, \mathrm{Ni}=28$ ]
28. (a) What are transition elements ? Would you classify Zn , cd and Hg as transition elements ? Give reasons for your answer.
(b) What is meant by 'disproportionation'? Give two examples of disproportionation reactions in aqueous solution. 2
29. Conductivity of $2 \times 10^{-3} \mathrm{M}$ methanoic acid is $8 \times 10^{-5} \mathrm{~S} \mathrm{~cm}^{-1}$. Calculate its molar conductivity and degree of dissociation if $\Lambda_{m}^{\circ}$ for methanoic acid is $404 \mathrm{~S} \mathrm{~cm}^{2} \mathrm{~mol}^{-1}$.
30. An antifreeze solution is prepared by dissolving 31 g of ethylene glycol (Molar mass $=62 \mathrm{~g} \mathrm{~mol}^{-1}$ ) in 600 g of water. Calculate the freezing point of the solution. ( $\mathrm{K}_{f}$ for water $=1.86 \mathrm{~K} \mathrm{~kg} \mathrm{~mol}^{-1}$ )

## SECTION - D

31. (a) Visha plotted a graph between concentration of $R$ and time for a reaction $R \longrightarrow P$. On the basis of this graph, answer the following questions:
$1 \times 3=3$

(i) Predict the order of reaction.
(ii) What does the slope of the line indicate?
(iii) What are the units of rate constant?
(b) A first order reaction takes 25 minutes for $25 \%$ decomposition. Calculate $t_{1 / 2}$.
[Given : $\log 2=0.3010, \log 3=0.4771, \log 4=0.6021$ ]
OR
(a) The rate constant for a first order reaction is $60 \mathrm{~s}^{-1}$. How much time will it take to reduce the initial concentration of the reactant to its $\frac{1}{16}$ th value ?
(b) Write four factors that affect the rate of a chemical reaction.
32. (a) Write an equation for the thermal decomposition of ammonium dichromate in solid state.
(b) $\mathrm{SCl}_{6}$ is not known, but $\mathrm{SF}_{6}$ is known. Why?
(c) Why electron gain enthalpies of noble gases are large positve.
(d) Give the molecular shapes of the following
(i) $\mathrm{XeO}_{2} \mathrm{~F}_{2}$
(ii) $\mathrm{BrF}_{5}$.

2
(a) Give reasons for the following observations :
(i) Halogens are strong oxidising agents.
(ii) Noble gases have very low boiling points.
(iii) O and Cl have nearly same electronegativity, yet oxygen forms H -bond while Cl doesn't.
(a) Complete and balance the following chemical equations:
(i) $\underset{\text { (cold }+ \text { dil.) }}{\mathrm{NaOH}}+\mathrm{Cl}_{2} \longrightarrow$
(ii) $\mathrm{I}^{-}(a q)+\mathrm{H}_{2} \mathrm{O}(l)+\mathrm{O}_{3}(g) \longrightarrow$
33. (a) An organic compound ' A ' having molecular formula $\mathrm{C}_{5} \mathrm{H}_{10} \mathrm{O}$ gives negative Tollen's test, forms $n$-pentane on Clemmenson reduction but doesn't give iodoform test. Identify ' A ' and give all the reactions involved. $1+1=2$
(b) Carry out the following conversions :
(i) Propanoic acid to 2-Bromopropanoic acid
(ii) Benzoyl chloride to benzaldehyde
(c) How will you distinguish between benzaldehyde and acetaldehyde?

OR
(a) Complete the following sequence of reactions:
$\mathrm{CH}_{3} \mathrm{COCH}_{3} \xrightarrow{\mathrm{Ba}(\mathrm{OH})_{2}}$
(A) $\xrightarrow[-\mathrm{H}_{2} \mathrm{O}]{\Delta}$
(B) $\xrightarrow{\mathrm{NaOH} / \mathrm{I}_{2}}$
(C)
$+(\mathrm{D})$
(i) Identify (A) to (D).
(ii) Give the IUPAC name of (A).
(b) How can you distinguish between :
(i) Ethanol and Propanone, and
(ii) Benzoic acid and Phenol?

## SOLUTION

1. (i) (d) Explanation : -I effect of F-atom stabilises the alkoxide ion.
(ii) (b) Explanation : - R effect of $-\mathrm{NO}_{2}$ group stabilises the phenoxide ion. $o$-Nitrophenol is slightly less acidic than p-nitrophenol. It is due to intramolecular H -bonding in $o$-nitrophenol.
(iii) (d) Explanation : Presence of three elections withdrawing $-\mathrm{NO}_{2}$ groups at $o$-and $p$-positions make 2,4, 6-trinitrophenol (picric acid) a strong acid.
(a) Explanation : Chlorine with its - I effect stabilises the phenoxide ion. The stabilising -I effect of chlorine decreases with the distance from oxygen.
(iv) (a) Explanation : Presence of electron donating methyl group in cresols destabilises the phenoxide ion. As such cresols are less acidic than phenol.
2. (i) (a) Reason is correct explanation of assertion
(ii) (d) Correct assertion : A gold sol in water, even when sufficiently diluted cannot pass through an ultrafilter paper.
(iii) (c) Correct reason : Soap is an example of associated colloid.
(iv) (a) Reason is correct explanation for assertion.

OR
(b) Correct explanation : Soap is an example of associated colloid.
3. (b) Explanation : Aromatic amines are weaker than aliphatic amines. In aqueous solution $2^{\circ}$ amine is most basic.

OR
(d) Explanation : Iodoform test is given by compounds having the structures :

or

Hence pentan -3- one does not give iodoform test
Explanation :

Pentan-3-one.
4. (c) Explanation : In $3 d$-series, $\mathrm{Mn}(\mathrm{Z}=25)$ shows maximum number of oxidation states.
5. (a) Explanation :

2, 2-Dinethylbutanoic acid

## OR

(c) Explanation :

6. (a) Explanation : Interstitial compounds are chemically inert. OR
(a) Explanation :
$\operatorname{Co}(\mathrm{Z}=27):[\mathrm{Ar}]^{18} 3 d^{7} 4 s^{2}$
$\mathrm{Co}^{3+}:[\mathrm{Ar}]^{18} 3 d^{6}$
Hence number of unpaired electrons $=4$
(c) Explanation :

3-Bromo-1-chlorocyclohex-1-ene.
8. (d) Explanation : More the number of resonating structures of the congugate base, more is the acidic strength.

OR
(a) Explanation : Due to H-bonding, H-F has highest boiling point i.e., it is least volatile.
9. (b) Explanation :

10. (d) Explanation : Phenols are more acidic than alcohols. Presence of electron withdrawing group (like chloro) increases the acidic strength.
11. (b) Explanation :

Let O.N. of $\mathrm{Cr}=x$
O.N. of $\mathrm{NH}_{3}=0$ and O.N. of $\mathrm{Cl}^{-}=-1$
$\therefore x+4 \times 0+2(-1)=+1$
$\therefore x=+3$
12. (c) Correct reason : van der Waals forces increase with increase in the size of halogen atom.
13. (a) Reason is the correct explanation for assertion.
14. (c) Correct reason : Polypeplide chain coils around to give it a globular shape.
15. (a) Reason is the correct explanation for assertion.
16. (d) Correct assertion : Carbylamine reaction or test is applicable to all primary amines both aliphatic and aromatic.

OR
(d) Correct assertion : $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$ is a stronger base than phenol and also a stronger nuclophile than phenol.
17. (i) Cannizzaro's reaction. When formaldehyde or benzaldehyde (aldehydes containing no $\alpha-\mathrm{H}$ atom) is treated with NaOH , then alcohol and sodium salt of the corresponding acid are formed.

(ii) Wolf-Kishner reduction. In this reduction aldehydes or ketones are reduced to hydrocarbons with hydrazine $\left(\mathrm{H}_{2} \mathrm{~N}-\mathrm{NH}_{2}\right)$ and KOH .

Propane
OR
(i) Clemmenson reduction. It involves the reduction of aldehydes and ketones to the corresponding hydrocarbons with amalgamated zinc $(\mathrm{Zn} / \mathrm{Hg})$ and conc. HCl .

(ii) Hell-Volhard Zelinsky reaction. Carboxylic acids (having $\alpha$-hydrogen) on heating with chlorine or bromine in the presence of small amount of red phosphorus undergo substitution at $\alpha$-carbon atom to form $\alpha$-haloacids.

18. (a) In alcohols, the oxygen atom is $s p^{3}$-hybridised with two lone pairs of electrons on it. Due to greater repulsion between two lone pairs of electrons, the $\mathrm{C}-\mathrm{O}-\mathrm{H}$ bond angle is less than the tetrahedral angle of $109^{\circ} 28^{\prime}$.

(b) The $\mathrm{C}-\mathrm{OH}$ bond in $\mathrm{CH}_{3} \mathrm{OH}$ is a pure single bond while the $\mathrm{C}-\mathrm{OH}$ bond in $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{OH}$ has some double bond character due to resonance. Hence the $\mathrm{C}-\mathrm{OH}$ bond length in methanol is slightly more than the $\mathrm{C}-\mathrm{OH}$ bond length in phenol.
19. (i) The tendency of transition metals to form alloys can be explained on the basis of their atomic sizes. The atomic size of transition metals are very similar and hence in the crystal lattice, atoms of one metal can readily replaced with atoms of another transition metals. This result in the formation of alloys.
(ii) Transition metals form a large number of complexes due to the following reasons :
(a) The presence of vacant $(n-1) d$-orbitals, which can accept one or more electron pairs from ligands.
(b) High charge desity an transition metal cations.

For example, $\left[\mathrm{Cu}\left(\mathrm{H}_{2} \mathrm{O}\right)_{4}\right]^{2+},\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+},\left[\mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+},\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]^{4-}$
20. Schottky Pefect : In a crystalline solid of type $A^{+} B^{-}$this type of defect is created when equal number of positive ions and negative ions are missing from their respective positions. Since the number of missing positive ions is equal to the number of missing negative ions the crystal as a whole is electrically neutral. This defect is more common in ionic compounds with high coordination number and where the ions (positive and negative) are of similar size. For example, $\mathrm{NaCl}, \mathrm{KCl}, \mathrm{CsCl}$ and KBr .

## Consequences of Schottky defect

(i) As ions are missing from their lattice sites, presence of large number of Schottky defect lowers the density of the crystal.
(ii) Ionic conductivity and diffusion in solid state in stoichiometric solids is due to the presence of lattice vacancies.

## OR

F-centres. The anioic sites occupied by unpaired electrons and responsible for the colour of the crystal are called $\mathbf{F}$-centres.
For example, When crystals of NaCl are heated in an atmosphere of sodium vapour, the Na atom are deposited on the surface of the crystal. The $\mathrm{Cl}^{-}$ions diffuse to the surface of the crystal and combine with Na atoms to form NaCl . This happens with the loss of electron by Na atoms to form $\mathrm{Na}^{+}$ions. The released electron

$$
\mathrm{Na} \longrightarrow \mathrm{Na}^{+}+e^{-}
$$

diffuse into the crystal and occupy and anionic sites. As a result the crystal now has excess of sodium. The anionic sites occupied by unpaired electrons are called F-centres. They impart yellow colour to the crystals of NaCl . The colour is due to the excitation of these electrons when they absorb energy from the visible light falling on the crystals. Similarly, excess of Li in LiCl crystals makes it pink and excess of K in KCl crystals makes it violet.

Fig. Schottky defect

Fig. An F-centre in a crystal
21. The reaction is first order w.r.t. A as well as w.r.t. B. Hence rate law is;

$$
\text { Rate }=k[\mathrm{~A}][\mathrm{B}]
$$

## Difference between average and instantaneous rates of a reaction :

Average rate of a reaction : Rate of reaction for a particular period of time or interval of time.
Instantaneous rate of a reaction. Rate of reaction at a particular instant of time.
22. The cell reactions involved are ;

$$
\begin{aligned}
\mathrm{Mg}(s) & \longrightarrow \mathrm{Mg}^{2+}(a q)+2 e^{-} \\
\mathrm{Mg}(a q) & \longrightarrow \mathrm{Ag}(s)] \times 2 \\
& \longrightarrow \mathrm{Mg}^{2+}(a q)+2 \mathrm{Ag}(s)
\end{aligned}
$$

Hence cell representation is ;

$$
\operatorname{Mg}(s)\left|\operatorname{Mg}^{2+}(a q) \| \mathrm{Ag}^{+}(a q)\right| \operatorname{Ag}(s)
$$

Here $n$ (Numbers of electrons transferred) $=2$
Hence Nernst equation is ;

$$
\begin{aligned}
\mathrm{E}_{\text {cell }} & =\mathrm{E}_{\text {cell }}^{\circ}-\frac{\mathrm{RT}}{n \mathrm{~F}} \ln \mathrm{Q}_{c} \\
\mathrm{E}_{\text {cell }} & =\mathrm{E}_{\text {cell }}^{\circ}-\frac{2 \cdot 303 \mathrm{RT}}{2 \mathrm{~F}} \log \frac{\left[\mathrm{Mg}^{2+}\right]}{\left[\mathrm{Ag}^{+}\right]^{2}} \\
\mathrm{R} & =8 \cdot 314 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}, \mathrm{~F}=96500 \mathrm{C} \mathrm{~mol} \\
\mathrm{~T} & =25^{\circ} \mathrm{C}=(25+273) \mathrm{K}=298 \mathrm{~K}
\end{aligned}
$$

Substituting these values;

$$
\mathrm{E}_{\text {cell }}=\mathrm{E}_{\text {cell }}^{\circ}-\frac{0 \cdot 059 \mathrm{~V}}{2} \log \frac{\left[\mathrm{Mg}^{2+}\right]}{\left[\mathrm{Ag}^{+}\right]^{2}}
$$

23. Mass of one unit cell $=z \times \frac{\mathrm{M}}{\mathrm{N}_{\mathrm{A}}}=\frac{2 \text { (for } \text { b.c.c. lattice) } \times 23 \mathrm{~g} \mathrm{~mol}^{-1}}{6.022 \times 10^{23} \mathrm{~mol}^{-1}}=7.66 \times 10^{-23} \mathrm{~g}$

Number of unit cells in $9.2 \mathrm{~g}=\frac{9.2 \mathrm{~g}}{7.66 \times 10^{-23} \mathrm{~g}}=\mathbf{1 . 2 0} \times \mathbf{1 0}^{\mathbf{2 3}}$
24. The lesser reactivity of haloarenes (say chlorobenzene) than haloalkanes (say chloromethane) in nucleophilic substitution reactions can be explained as follows :
(i) Resonance effect : Haloarenes are resonance stabilised. For example, chlorobenzene is a resonance hybrid of various contributing structures (I) to (V) as shown below :

As a result of resonance, in structure (II) to (IV), $\mathrm{C}-\mathrm{Cl}$ bond acquires some double bond character. On the other hand, no such resonance occurs in alkyl halides. Therefore, $\mathrm{C}-\mathrm{Cl}$ bond in aryl halides is stronger than carbon-halogen bond in haloalkanes and hence can not be easily broken, so chlorobenzene is less reactive.
(ii) Hybridisation of carbon bearing the halogen atom. In haloalkanes, the carbon atom attached to the halogen atom ( $\mathrm{C}-\mathrm{X}$ ) is $s p^{3}-$ hybridised whereas in haloarenes, the carbon atom attached to the halogen atom is $s p^{2}$-hybridised. Now $s p^{2}$-hybrid orbital of carbon is slightly smaller in size than the $s p^{3}$-hybrid orbital. Therefore, the carbon-halogen bond in haloarenes is shorter and stronger than the carbon-halogen bond in haloalkanes. This also justify the low reactivity of haloarenes.

## OR

KCN is an ionic solid which ionises in polar solvents like ethanol to give $\mathrm{CN}^{-}$ions.

$$
\mathrm{K}^{+} \mathrm{CN}^{-} \rightleftharpoons \mathrm{K}^{+}+\mathrm{CN}^{-}
$$

Attack of $\mathrm{CN}^{-}$on alkyl halides gives alkyl cyanide as main product.

$$
\mathrm{R}-\mathrm{X}+\mathrm{CN}^{-} \longrightarrow \mathrm{R}-\mathrm{C} \equiv \mathrm{~N}+\mathrm{X}^{-}
$$

On the other hand, AgCN is a covalent solid in which $\mathrm{Ag}-\mathrm{CN}$ bond has a large covalent character. As such, it does not give $\mathrm{CN}^{-}$ ions to act as neucleophiles. Here $\mathrm{Ag}-\mathrm{C} \equiv \ddot{\mathrm{N}}$ itself act as a nucleophile with the lone pair of electrons on nitrogen acting as electrohilic centre.

As such the main product obtained in this case is an isocyanide.
25. (a) Basic character of amines is due to the presence of lone pair of electrons on nitrogen atom.

Aniline

$$
\mathrm{C}_{2} \mathrm{H}_{5} \rightarrow \ddot{\mathrm{~N}}_{2}
$$

Ethanamine

In aniline the lone pair of electrons on nitrogen atom is in conjugation with the benzene ring. This reduces the availability of lone pair of electrons thus reducing its basic character. On the other hand, the +I effect of ethyl group in ethanamine increases the availability of electron pair on nitrogen atom thus increasing its basic character.
(b) Aniline is a Lewis base while anhydrous $\mathrm{AlCl}_{3}$ (which is used as a catalyst in Friedel Crafts reaction) is a Lewis acid. This results in a salt formation between the two and as such Friedel Crafts reaction is not possible in aniline.
26. The three given alkyl halides are ;

2-Bromo-2-methylpropane ( $3^{\circ}$ )
(i) In $\mathrm{S}_{\mathrm{N}} 1$ reactions, more stable the carbocation formed, more is the reactivity. The stability of carbocation is in the order

$$
3^{\circ}>2^{\circ}>1^{\circ}
$$

Hence, the order of reactivity of given alkyl halides is ;
1-Bromobutane $<2$-Bromobutane $<2$-Bromo-2-methylpropane
(ii) In $\mathrm{S}_{\mathrm{N}}$ 2 reactions, more the steric hindrance on the C -atom attached to halogen, lesser is the reactivity. Hence the order of reactivity of given alkyl halides is ;

2-Brono-2-methyl propane $<2$-Bromobutane $<$ 1-Bromobutane
27. (a) $\mathrm{K}_{4}\left[\mathrm{Mn}(\mathrm{CN})_{6}\right]$

IUPAL name : potassium hexacyanidomanganate(II)
$\operatorname{Mn}(\mathrm{Z}=25):[\mathrm{Ar}]^{18} 4 s^{2} 3 d^{5}$
$\mathrm{Mn}^{2+}:[\mathrm{Ar}]^{18} 3 d^{5}$
Here, $\mathrm{CN}^{-}$is a strong field ligand. It will pair up the five $3 d$-electrons in three orbitals with lower energy of $t_{2 g}$ set. Thus electronic configuration of Mn in the presence of six $\mathrm{CN}^{-}$ions is ;

$$
t_{2 g}{ }^{5} \quad e_{g}^{0}
$$

(b) Chelate effect : Increased stability of the complex due to the presence of chelating (didentate or polydentate) ligands is called chelate effect. For example, $\left[\mathrm{Cu}(\text { en })_{2}\right]^{2+}$ is more stable than $\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}$

## OR

(i) $\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]^{4-}$
O.S. of $\mathrm{Fe}=+2$
$\mathrm{Fe}^{2+}:[\mathrm{Ar}]^{18} 3 d^{6}$
In the presence of six $\mathrm{CN}^{-}$ligands ( $\mathrm{CN}^{-}$is a strong field ligand) the six $3 d$-electrons pair up in three $3 d$-orbitals. Thus hybridisation is $d^{2} s p^{3}$ and the complex is diamagnetic as there is no unpaired electron is the complex.
(ii) $\left[\mathrm{CoF}_{6}\right]^{3-}$
O.S. of $\mathrm{Co}=+3$
$\mathrm{Co}^{3+}:[\mathrm{Ar}]^{18} 3 d^{6}$

In the presence of six $\mathrm{F}^{-}$ligands ( $\mathrm{F}^{-}$is a weak field ligand) the electrons in the $3 d$-subshell do not pair up. As such hybridisation is $s p^{3} d^{2}$ and the complex is paramagnetic as it has four unpaired elections.
(iii) $\left[\mathrm{Ni}(\mathrm{CO})_{4}\right]$
O.S. of $\mathrm{Ni}=0$
$\mathrm{Ni}(\mathrm{Z}=28):[\mathrm{Ar}]^{18} 4 s^{2} 3 d^{8}$
In the presence of four CO ligands (CO is a strong field ligand) the eight $3 d$-elections pair up in four $3 d$-orbitals. Thus hybridisation is $d s p^{2}$ and the complex is diamagnetic as there is no unpaired electron in the complex.
28. (a) According to definition, the transition elements are those which have partly filled $d$-orbitals in their elementary form or in their commonly occurring oxidation state. Since $\mathrm{Zn}, \mathrm{Cd}$ and Hg do not have partly filled $d$-orbitals in their elementary states or most common oxidation states, these are not classified as a transition elements.
(b) When a particular oxidation state becomes less stable relative to other oxidation states, one lower, one higher, it is said to undergo disproportionation.

## Examples:

(i) $\operatorname{Copper}(\mathrm{I})$ ion is not stable in aqueous solutions. This is because $\mathrm{Cu}(\mathrm{I})$ becomes unstable relative to $\mathrm{Cu}(\mathrm{II})$ and $\mathrm{Cu}(0)$ in aqueous solution.

$$
\underset{(\mathrm{O} . \text { S. of } \mathrm{Cu}=+1)}{2 \mathrm{Cu}^{+}(a q)} \underset{(\mathrm{O} \text { O.S. of } \mathrm{Cu}=+2)}{\mathrm{Cu}^{2+}(a q)}+\underset{(\mathrm{O} . \mathrm{S} \text {. of } \mathrm{Cu}=0)}{\mathrm{Cu}(s)}
$$

The $\mathrm{E}^{0}$ value for this reaction is favourable. This is because the $\Delta_{\text {hyd }} \mathrm{H}^{\circ}$ of $\mathrm{Cu}^{2+}(a q)$ is much more negative than $\mathrm{Cu}^{+}$, which more than compensates for the second ionisation enthalpy of copper.
(ii) Manganese(VI) becomes unstable relative to Mn (VII) and $\mathrm{Mn}(\mathrm{IV})$ in acidic solution.

$$
\underset{(\mathrm{O} . \text { S. of } \mathrm{Mn}=+6)}{3 \mathrm{MnO}_{4}^{2-}}+4 \mathrm{H}^{+} \longrightarrow \underset{(\text { O.S. of } \mathrm{Mn}=+7)}{2 \mathrm{MnO}_{4}^{-}}+\underset{(\mathrm{O} \text { (O.S. of } \mathrm{Mn}=+4)}{\mathrm{MnO}_{2}}+2 \mathrm{H}_{2} \mathrm{O}
$$

29. $\mathrm{K}=8 \times 10^{-5} \mathrm{~S} \mathrm{~cm}^{-1}, \mathrm{C}=2 \times 10^{-3} \mathrm{~mol} \mathrm{~L}^{-1}$

$$
\begin{aligned}
\lambda_{m} & =? \\
\lambda_{m} & =\frac{\kappa \times 1000 \mathrm{~cm}^{3} \mathrm{~L}^{-1}}{\mathrm{C}} \\
& =\frac{\left(8 \times 10^{-5} \mathrm{Scm}^{-1}\right) \times\left(1000 \mathrm{~cm}^{3} \mathrm{~L}^{-1}\right)}{\left(2 \times 10^{-3} \mathrm{molL}^{-1}\right)} \\
& =40 \mathrm{~S} \mathrm{~cm}^{2} \mathrm{~mol}^{-1} \\
\alpha & =\frac{\lambda_{m}}{\lambda_{m}^{\circ}}=\frac{40 \mathrm{Scm}^{2} \mathrm{~mol}^{-1}}{404 \mathrm{Scm}^{2} \mathrm{~mol}^{-1}}=\mathbf{0 . 0 9 9}
\end{aligned}
$$

30. 

$$
\begin{aligned}
& \mathrm{W}_{\mathrm{B}}=31 \mathrm{~g} \mathrm{~W} \\
& \mathrm{M}_{\mathrm{B}}=600 \mathrm{~g}=0.6 \mathrm{~kg} \\
&=62 \mathrm{~g} \mathrm{~mol}^{-1}, \mathrm{~K}_{f}=1.86 \mathrm{~K} \mathrm{~kg} \mathrm{~mol}^{-1}, \Delta \mathrm{~T}_{f}=? \\
& \Delta \mathrm{~T}_{f}=\mathrm{K}_{f} \times \frac{\mathrm{W}_{\mathrm{B}}}{\mathrm{M}_{\mathrm{B}}} \times \frac{1}{\mathrm{~W}_{\mathrm{A}}(\mathrm{~kg})} \\
&=\frac{\left(1.86 \mathrm{~K} \mathrm{~kg} \mathrm{~mol}^{-1}\right) \times(31 \mathrm{~g})}{\left(62 \mathrm{~g} \mathrm{~mol}^{-1}\right) \times(0.6 \mathrm{~kg})}=1.55 \mathrm{~K}
\end{aligned}
$$

$$
\begin{aligned}
\mathrm{T}_{f}^{\circ} & =273 \cdot 15 \mathrm{~K}, \mathrm{~T}_{f}=? \\
\Delta \mathrm{~T}_{f} & =\mathrm{T}_{f}^{\circ}-\mathrm{T}_{f} \\
\mathrm{~T}_{f} & =\mathrm{T}_{f}^{\circ}-\Delta \mathrm{T}_{f}=(273 \cdot 15-15-1 \cdot 55) \mathrm{K} \\
& =271 \cdot 6 \mathrm{~K}
\end{aligned}
$$

31. (a) (i) As graph between conc. of R vs. time is a straight line, it is a zero order reaction.
(ii) For a zero order reaction, rate of reaction

$$
-\frac{d[\mathrm{R}]}{d t}=k
$$

or

$$
-d[\mathrm{R}]=k d t
$$

Integrating,

$$
-\int d[\mathrm{R}]=k \int d t
$$

$$
-[\mathrm{R}]=k t+c
$$

$$
\text { when } \quad t=0,[\mathrm{R}]=[\mathrm{R}]_{0}
$$

$\therefore \quad-[\mathrm{R}]_{0}=c$
substituting $\quad-[\mathrm{R}]=0-k t-[\mathrm{R}]_{0}$
$[\mathrm{R}]=-k t+[\mathrm{R}]_{0}$
Thus graph of $[\mathrm{R}]$ (along $y$-axis) and $t$ (along $x$-axis) is a straight line with

$$
\text { slope }=-k
$$

(iii) For a zero order reaction,

$$
\text { Rate }=k
$$

$\therefore \quad$ units of $k=$ units of rate of reaction
$=\mathrm{mol} \mathrm{L}^{-1} \mathrm{~s}^{-1}$
(b)

$$
\begin{aligned}
{[\mathrm{R}]_{0} } & =100(\text { say }) \therefore[\mathrm{R}]=100-25=75 \\
t & =25 \mathrm{~min}, k=?
\end{aligned}
$$

For a first order reaction,

$$
\begin{aligned}
k & =\frac{2.303}{t} \log \frac{[\mathrm{R}]_{0}}{[\mathrm{R}]}=\frac{2.303}{25 \mathrm{~min}} \log \frac{100}{75} \\
& =\frac{2.303}{25 \mathrm{~min}} \log \frac{4}{3}=\frac{2.303}{25 \mathrm{~min}}[\log 4-\log 3] \\
& =\frac{2.303}{25 \mathrm{~min}}(0.6021-0.4771) \\
& =\frac{2.303 \times 0.01250}{25} \mathrm{~min}^{-1}=0.0115 \mathrm{~min}^{-1} \\
\therefore \quad t_{1 / 2} & =\frac{0.693}{k}=\frac{0.693}{0.0115 \mathrm{~min}^{-1}}=\mathbf{6 0 . 2 6} \mathbf{~ m i n}
\end{aligned}
$$

OR
(a) $k=60 \mathrm{~s}^{-1},[\mathrm{R}]_{0}=1($ say $),[\mathrm{R}]=\frac{1}{16}, t=$ ?

For a first order reaction,

$$
\begin{aligned}
t & =\frac{2 \cdot 303}{k} \log \frac{[\mathrm{R}]_{0}}{[\mathrm{R}]} \\
& =\frac{2 \cdot 303}{60 \mathrm{~s}^{-1}} \log \frac{1}{1 / 16}
\end{aligned}
$$

$$
\begin{aligned}
& =\frac{2.303}{60 \mathrm{~s}^{-1}} \log 16=\frac{2.303}{60 \mathrm{~s}^{-1}} \log 2^{4} \\
& =\frac{2.303 \times 4 \log 2}{60} \mathrm{~s} \\
& =\frac{2.303 \times 4 \times 0.3010}{60} \mathrm{~s}=\mathbf{0 . 0 4 6} \mathrm{s}
\end{aligned}
$$

(b) Four factors that affect the rate of a chemical reaction are ;
(i) Temperature (ii) Concentration of reactants (iii) Pressure (iv) Presence of light in case of photochemical reactions (v) Surface area or physical state of solid reactant.
32. (a) $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}(s) \xrightarrow{\text { Heat }} \mathrm{Cr}_{2} \mathrm{O}_{3}(s)+\mathrm{N}_{2}(g)+4 \mathrm{H}_{2} \mathrm{O}(g)$
(b) Fluorine is a much stronger oxidising agent than chlorine, therefore, it can easily oxidise sulphur to its maximum oxidation state of +6 and hence forms $\mathrm{SF}_{6}$. Chlorine, on the other hand, being a weaker oxidising agent can oxidise sulphur only to its +4 oxidation state and hence can form $\mathrm{SCl}_{4}$ but not $\mathrm{SCl}_{6}$.
(c) The members of the noble gas family have $n s^{2} n p^{6}$ configuration. As such noble gases have no tendency to accept electrons and thus have large positive electron gain enthalpies i.e., large amount of energy is needed to add an electron to an atom of the noble gas.
(i) (d)

OR
(a) (i) Halogens are strong oxidising agents because they can readily accept one electron to attain nearest noble gas configuration.
(ii) Noble gases have very low boiling points because the intermolecular forces of attraction are very weak London dispersion forces.
(iii) Two factors needed for an element to form H-bonding are high electronegativity and small atomic size. As atomic size of Cl is much larger than $\mathrm{O}, \mathrm{O}$ form H -bond while Cl cannot form H -bond.
(b) (i) $\quad \mathrm{Cl}_{2}+\mathrm{H}_{2} \mathrm{O} \longrightarrow \mathrm{HCl}+\mathrm{HOCl}$
$\mathrm{HCl}+\mathrm{NaOH} \longrightarrow \mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}$
$\mathrm{HOCl}+\mathrm{NaOH} \longrightarrow \mathrm{NaOCl}+\mathrm{H}_{2} \mathrm{O}$
$\mathrm{Cl}_{2}+2 \mathrm{NaOH} \longrightarrow \mathrm{NaCl}+\mathrm{NaOCl}+\mathrm{H}_{2} \mathrm{O}$
(ii)
$\mathrm{O}_{3}(\mathrm{~g}) \longrightarrow \mathrm{O}_{2}(\mathrm{~g})+[\mathrm{O}]$
$2 \mathrm{I}^{-}(a q)+\mathrm{H}_{2} \mathrm{O}(l)+[\mathrm{O}] \longrightarrow \mathrm{I}_{2}(s)+2 \mathrm{OH}^{-}(a q)$
$\mathrm{O}_{3}(g)+2 \mathrm{I}^{-}(a q)+\mathrm{H}_{2} \mathrm{O}(l) \longrightarrow \mathrm{O}_{2}(g)+\mathrm{I}_{2}(s)+2 \mathrm{OH}^{-}(a q)$
33. (a) As compound $\mathbf{A}$ gives negative Tollen's test and on Clemmenson reduction gives n-pentane, compound $\mathbf{A}$ is a ketone. As $\mathbf{A}$ does not give iodoform test, it is not a methyl ketone. Hence $\mathbf{A}$ is;

Clemmenson reduction of $\mathbf{A}$;

(b) (i) Propanoic acid to 2-Bromopropanoic acid

(ii) Benzoyl chloride to Benzaldehyde

(c)

Benzaldehyde

Acetaldehyde

Out of these two aldehydes only acetaldehyde will give a yellow ppt. of iodoform $\left(\mathrm{CHI}_{3}\right)$ on heating with $\mathrm{I}_{2}+\mathrm{NaOH}$ (Iodoform test).

OR

Acetone (Two molecules)
(A)

(B)
(C)
(D)

IUPAC name of A

(b) $(i)$

Out of these two compounds only propanone gives an orange ppt. with 2, 4-dinitrophenylhydrazine.
(ii)

Benzoic acid

Phenol

Out of these two compounds only an aqueous solution of benzoic acid gives brisk effervescence with $\mathrm{NaHCO}_{3}$.

# Sample Question Paper-5 

## Chemistry (Theory)-XII

Time Allowed : 3 hours
Maximum Marks : 70
General Instructions : Same as in Sample Paper - 1

## SECTION - A (Objective Type)

1. Read the following and answer the questions $(i)$ to $(i v)$ that follows :
$1 \times 4=4$
In alkylamines, a combination of electron releasing, steric and H -bonding factors influence the stability of the substituted ammonium cations in protic polar solvents and thus affect the basic nature of amines. Alkyl amines are found to be stronger bases than ammonia. In aromatic amines, electron releasing and withdrawing groups, respectively increase and decrease their basic character. Aniline is a weaker base than ammonia.
Basic character of amines in non-aqueous solutions or in vapour state :

$$
3^{\circ}>2^{\circ}>1^{\circ}>\mathrm{NH}_{3}
$$

Basic character of aliphatic amines (methyl and ethyl) in aqueous solutions :

$$
\begin{gathered}
\left(\mathrm{C}_{2} \mathrm{H}_{5}\right)_{2} \mathrm{NH}>\left(\mathrm{C}_{2} \mathrm{H}_{5}\right)_{3} \mathrm{~N}>\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NH}_{2}>\mathrm{NH}_{3} \\
\left(\mathrm{CH}_{3}\right)_{2} \mathrm{NH}>\mathrm{CH}_{3} \mathrm{NH}_{2}>\left(\mathrm{CH}_{3}\right)_{3} \mathrm{~N}>\mathrm{NH}_{3}
\end{gathered}
$$

Basic character of aromatic amines :

$o$-Substituted amines are usually weaker bases than aniline irrespective of nature of substituent (i.e., electron withdrawing or releasing group) due to ortho effect, which is due to steric hindrance.

$$
\left(\mathrm{C}_{6} \mathrm{H}_{5}\right)_{3} \mathrm{~N}<\left(\mathrm{C}_{6} \mathrm{H}_{5}\right)_{2} \mathrm{NH}<\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2}<\mathrm{NH}_{3}
$$

This is because phenyl group is electron withdrawing in nature due to -R effect.
(i) Which is most basic in aqueous medium ?
(a) $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2}$
(b) $\left(\mathrm{C}_{6} \mathrm{H}_{5}\right)_{2} \mathrm{NH}$
(c) $\mathrm{CH}_{3} \mathrm{NH}_{2}$
(d) $\left(\mathrm{CH}_{3}\right)_{2} \mathrm{NH}$.
(ii) Among the compounds $\mathrm{C}_{3} \mathrm{H}_{7} \mathrm{NH}_{2}, \mathrm{NH}_{3}, \mathrm{CH}_{3} \mathrm{NH}_{2}, \mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NH}_{2}$ and $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2}$, the least basic is :
(a) $\mathrm{C}_{3} \mathrm{H}_{7} \mathrm{NH}_{2}$
(b) $\mathrm{NH}_{3}$
(c) $\mathrm{CH}_{3} \mathrm{NH}_{2}$
(d) $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2}$
(iii) The order of basicity of
(I) $p$-Methylaniline
(II) $m$-Methylaniline
(III) Aniline
(IV) o-Methylaniline
is :
(a) (I) $>$ (II) $>$ (III) $>$ (IV)
(b) (I) $>$ (II) $>$ (IV) $>$ (III)
(c) (IV) $>$ (I) $>$ (II) $>$ (III)
(d) (II) $>$ (I) $>$ (IV) $>$ (III)
(iv) The correct increasing order of basic strength for the following compounds is :

(I)

(II)

(III)
(a) II $<$ III $<$ I
(b) III $<$ I $<$ II
(c) III $<$ II $<$ I
(d) II $<$ I $<$ III.

## OR

Which is least basic?

(I)

(II)

(III)

(IV)
(a) (I) (b) (II) (c) (III) (d) (IV).
2. Read the following and answer the questions $(i)$ to (iv) that follows :

Colloidal particles always carry an electric charge which may be either positive or negative. For example, when $\mathrm{AgNO}_{3}$ solution is added to KI solution, a negatively charged colloidal sol is obtained. The presence of equal and similar charges on colloidal particles provide stability to the colloidal sol and if, somehow, charge is removed, coagulation of sol occurs. Lyophobic sols are readily coagulated as compared to lyophilic sols.
The questions given below consist of Assertion and Reason. Use the following keys to select the correct answer.
(a) If both assertion and reason are correct and reason is correct explanation for assertion.
(b) If both assertion and reason are correct but reason is not correct explanation for assertion.
(c) If assertion is correct but reason is incorrect.
(d) If assertion is wrong but reason is correct.
(i) Assertion : When an aqueous solution of $\mathrm{AgNO}_{3}$ is added to a solution of KI in water, a negatively charged colloidal solution is obtained.
Reason : It is due to the adsorption of negatively charged $\mathrm{NO}_{3}^{-}$ions by the colloidal particles.
(ii) Assertion : When an aqueous solution of KI is added to a solution of $\mathrm{AgNO}_{3}$ in water a positively charged sol is obtained.
Reason : It is due to the adsorption of positively charged $\mathrm{Ag}^{+}$ions by the colloidal particles.
(iii) Assertion : Lyophobic sols are readily coagulated.

Reason : This is because dispersed phase is insoluble in the dispersion medium.
(iv) Assertion : Lyophilic sols are not readily coagulated.

Reason : In lyophilic sols colloidal particles are highly solvated.
OR
Assertion : When an aqueous solution of ferric chloride is added to a solution of sodium hydroxide in water, a negatively charged colloidal sol of hydrated ferric oxide is obtained.
Reason : It is due to the adsorption of negatively charged oxide ions by the colloidal particles.

Following questions (Q.No. 3 to Q.No. 11) are multiple choice questions carrying 1 mark.
3. The number of unpaired electrons in $\mathrm{Fe}^{2+}$ are :
(a) 2
(b) 4
(c) 6
(d) 3 .
4. The magnetic nature of elements depend on the presence of unpaired electrons. Identify the configuration of transition element, which shows highest magnetic moment.
(a) $3 d^{7}$
(b) $3 d^{5}$
(c) $3 d^{8}$
(d) $3 d^{2}$.
5. Electronic configuration of a transition element X in +3 oxidation state is $[\mathrm{Ar}] 3 d^{5}$. What is its atomic number ?
(a) 25
(b) 26
(c) 27
(d) 24 .

## OR

With respect to aqueous solutions of copper salts, which of the following is correct ?
(a) $\mathrm{Cu}(\mathrm{II})$ is more stable
(b) Cu (II) is less stable
(c) $\mathrm{Cu}(\mathrm{I})$ and Cu (II) are equally stable
(d) $\mathrm{Cu}(\mathrm{I})$ and $\mathrm{Cu}(\mathrm{II})$ are equally unstable.
6. The species having tetrahedral shape is :
(a) $\left[\mathrm{PdCl}_{4}\right]^{2-}$
(b) $\left[\mathrm{Ni}(\mathrm{CN})_{4}\right]^{2-}$
(c) $\left[\mathrm{Pb}(\mathrm{CN})_{4}\right]^{2-}$
(d) $\left[\mathrm{NiCl}_{4}\right]^{2-}$
OR

Which of the following forms with an excess of $\mathrm{CN}^{-}$ions, a complex having co-ordination number two ?
(a) $\mathrm{Cu}^{+}$
(b) $\mathrm{Ag}^{+}$
(c) $\mathrm{Ni}^{2+}$
(d) $\mathrm{Fe}^{2+}$.
7. Shape of $\mathrm{XeOF}_{4}$ is :
(a) octahedral
(b) square pyramidal
(c) pyramidal
(d) T-shaped
8. Among trihalide of nitrogen, which one is least basic ?
(a) $\mathrm{NF}_{3}$
(b) $\mathrm{NCl}_{3}$
(c) $\mathrm{NBr}_{3}$
(d) $\mathrm{NI}_{3}$.
9. What is maximum no. of hydrogen bonds in which a water molecule may participate is:
(a) 1
(b) 2
(c) 3
(d) 4

## OR

Which of the following element has maximum electron gain enthapy (negative)?
(a) F
(b) Cl
(c) Br
(d) I.
10.
 $\mathrm{NH}_{2}$ on heating with $\mathrm{CHCl}_{3}$ and alcoholic KOH gives foul smell of
(a)

(b)

(c)

(d)

11. 50 mL of an aqueous solution of glucose $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$ (Molar mass : $180 \mathrm{~g} / \mathrm{mol}$ ) contains $6.02 \times 10^{22}$ molecules. The concentration of the solution will be
(a) $0 \cdot 1 \mathrm{M}$
(b) 0.2 M
(c) 1.0 M
(d) $2 \cdot 0 \mathrm{M}$

## OR

If the standard electrode potential of an electrode is greater than zero, then we can infer that its
(a) reduced form is more stable compared to hydrogen gas
(b) oxidised form is more stable compared to hydrogen gas
(c) reduced and oxidised forms are equally stable
(d) reduced form is less stable than the hydrogen gas

For question numbers 12 to $\mathbf{1 6}$ two statements are given - one labelled Assertion (A) and the other labelled Reason (R). Select the correct answer to these questions from the codes $(a),(b),(c)$ and $(d)$ as given below : $1 \times 5=5$
(a) Both Assertion (A) and Reason (R) are correct statements, and Reason (R) is the correct explanation of the Assertion (A).
(b) Both Assertion (A) and Reason (R) are correct statements, but Reason (R) is not the correct explanation of the Assertion (A).
(c) Assertion (A) is correct, but Reason (R) is incorrect statement.
(d) Assertion (A) is incorrect, but Reason (R) is correct statement.
12. Assertion (A) : Conductivity of an electrolyte decreases with decrease in concentration.

Reason (R): Number of ions per unit volume increase on dilution.
13. Assertion (A) : The $\mathrm{C}-\mathrm{O}-\mathrm{H}$ bond angle in alcohols is slightly less than the tetrahedral angle.

Reason (R): This is due to the repulsive interaction between the two lone pairs of electron on oxygen.
14. Assertion (A) : $\left[\operatorname{Pt}(e n)_{2} \mathrm{Cl}_{2}\right]^{2+}$ complex is less stable than $\left[\mathrm{Pt}\left(\mathrm{NH}_{3}\right)_{4} \mathrm{Cl}_{2}\right]^{2+}$ complex.

Reason (R): $\left[\mathrm{Pt}(e n)_{2} \mathrm{Cl}_{2}\right]^{2+}$ complex shows chelate effect.
15. Assertion (A) : Osmotic pressure is a colligative property.

Reason (R): Osmotic pressure is directly proportional to molarity.
16. Assertion (A) : Reactivity of ketones is more than aldehydes.

Reason (R): The carbonyl carbon of ketones is less electrophilic as compared to aldehydes.

## OR

Assertion (A) : Aromatic aldehydes and formaldehyde undergo Cannizzaro reaction.
Reason (R): Aromatic aldehydes are almost as reactive as formaldehyde.

## SECTION - B

17. In the given reaction

$$
\mathrm{A}+3 \mathrm{~B} \longrightarrow 2 \mathrm{C}
$$

the rate of formation of C is $2.5 \times 10^{-4} \mathrm{~mol} \mathrm{~L}^{-1} \mathrm{~s}^{-1}$
Calculate the average
(i) rate of reaction, and
(ii) rate of disappearance of B.
18. Illustrate how copper metal can give different products on reaction with $\mathrm{HNO}_{3}$.

OR
(i) The HNH angle value is higher than $\mathrm{HPH}, \mathrm{H}$ as H and H sh H angles. Why?
(ii) Explain why $\mathrm{NH}_{3}$ is basic while $\mathrm{BiH}_{3}$ is only feebly basic.
19. Write two differences between Lyophilic colloids and Lyophobic colloids.

## OR

Define the following terms with a suitable example of each :
(i) Associated colloids
(ii) Multimolecular colloids
20. (a) Write the IUPAC name and hybridisation of the complex $\left[\mathrm{CoF}_{6}\right]^{3-}$.
(Given : Atomic number of $\mathrm{Co}=27$ )
(b) $\left[\mathrm{NiCl}_{4}\right]^{2-}$ is paramagnetic while $\left[\mathrm{Ni}(\mathrm{CO})_{4}\right]$ is diamagnetic, though both are tetrahedral. Why ?
21. Differentiate between globular and fibrous proteins.
22. Write short notes on the following :
(i) Finkelstein reaction (ii) Hunsdiecker reaction.

OR
Write short notes on the following :
(i) Etard reaction (ii) Gatterman-Koch reaction
23. Write the products of the following reaction :

$$
6 \mathrm{XeF}_{4}+12 \mathrm{H}_{2} \mathrm{O} \longrightarrow
$$

Is this reaction a disproportionation reaction ? Give reasons in support of your answer.
24. Calculate the $\log \mathrm{K}_{c}$ for the given reaction at 298 K : 3

$$
\mathrm{Ni}(s)+2 \mathrm{Ag}^{+}(a q) \quad \rightleftharpoons \mathrm{Ni}^{2+}(a q)+2 \mathrm{Ag}(s)
$$

Given :

$$
\mathrm{E}_{\mathrm{Ni}^{2+} / \mathrm{Ni}}^{\circ}=-0.25 \mathrm{~V}, \mathrm{E}_{\mathrm{Ag}^{+} / \mathrm{Ag}}^{\circ}=+0.80 \mathrm{~V}, 1 \mathrm{~F}=96500 \mathrm{C} \mathrm{~mol}^{-1}
$$

25. A first order reaction is $40 \%$ complete in 80 minutes. In what time will the reaction be $90 \%$ completed ?
[Given : $\log 2=0 \cdot 3010, \log 3=0 \cdot 4771, \log 4=0 \cdot 6021, \log 5=0 \cdot 6990, \log 6=0 \cdot 7782$ ]

## SECTION - C

26. An organic compound (A) with molecular formula $\mathrm{C}_{8} \mathrm{H}_{8} \mathrm{O}$ gives positive DNP and iodoform tests. It does not reduce Tollen's or Fehling's reagents and does not decolourise bromine water also. On oxidation with chromic acid $\left(\mathrm{H}_{2} \mathrm{CrO}_{4}\right)$, it gives a carboxylic acid (B), with molecular formula $\mathrm{C}_{7} \mathrm{H}_{6} \mathrm{O}_{2}$. Deduce the structures of ' A ' and ' B '.

## OR

Draw the structure of monohalo products in each of the following reactions :
(i)

(ii)

(iii)

27. Write the major product(s) of the following reactions :
(i)

(ii)

(iii)

28. (a) Write the mechanism of the following reaction :

$$
2 \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH} \xrightarrow[413 \mathrm{~K}]{\mathrm{H}^{+}} \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OCH}_{2} \mathrm{CH}_{3}+\mathrm{H}_{2} \mathrm{O}
$$

(b) Write the preparation of phenol from cumene.

How can you convert the following :
(i) Sodium phenoxide to o-hydroxybenzoic acid
(ii) Acetone to propene
(iii) Phenol to chlorobenzene
29. Write the products formed when $\left(\mathrm{CH}_{3}\right)_{3} \mathrm{C}-\mathrm{CHO}$ reacts with the following reagents :
(i) $\mathrm{CH}_{3} \mathrm{COCH}_{3}$ in the presence of dilute NaOH
(ii) HCN
(iii) Conc. NaOH
30. X-ray diffraction studies show that copper crystallises in an $f c c$ unit cell with cell edge of $3.608 \times 10^{-8} \mathrm{~cm}$. In a separate experiment, copper is determined to have a density of $8.96 \mathrm{~g} / \mathrm{cm}^{3}$, calculate the atomic mass of copper.

## SECTION - D

31. (a) Give reasons :
(i) Helium does not form compounds like Xenon.
(ii) $\mathrm{HClO}_{4}$ is a stronger acid than HOCl .
(iii) Sulphur is a polyatomic solid whereas oxygen is a diatomic gas.
(b) Write one reaction as an example of each, to show that conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$ acts as
(i) an oxidising agent, and
(ii) a dehydrating agent.

## OR

(a) Account for the following :
(i) Hydration enthalpy of $\mathrm{F}^{-}$ion is more than $\mathrm{Cl}^{-}$ion.
(ii) $\mathrm{SO}_{2}$ is a reducing agent, whereas $\mathrm{TeO}_{2}$ is an oxidising agent in Group-16 oxides. 1
(b) Write the reaction of $\mathrm{F}_{2}$ with water. Why does $\mathrm{I}_{2}$ not react with water ? $\quad 1+1$
(c) Draw the structure of $\mathrm{XeF}_{2}$. $\quad 1$
32. (a) Give reasons : 3
(i) Although $-\mathrm{NH}_{2}$ group is $o / p$ directing in electrophilic substitution reactions, yet aniline, on nitration gives good yield of $m$-nitroaniline.
(ii) $\left(\mathrm{CH}_{3}\right)_{2} \mathrm{NH}$ is more basic than $\left(\mathrm{CH}_{3}\right)_{3} \mathrm{~N}$ in an aqueous solution.
(iii) Ammonolysis of alkyl halides is not a good method to prepare pure primary amines.
(b) Distinguish between the following :
(i) $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{NH}_{2}$ and $\left(\mathrm{CH}_{3} \mathrm{CH}_{2}\right)_{2} \mathrm{NH}$
(ii) Aniline and $\mathrm{CH}_{3} \mathrm{NH}_{2}$

## OR

(a) Write the structures of A and B in the following reactions:
(i) $\mathrm{CH}_{3} \mathrm{COOH} \xrightarrow[\Delta]{\mathrm{NH}_{3}} \mathrm{~A} \xrightarrow{\mathrm{NaOBr}} \mathrm{B}$
(ii) $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2} \xrightarrow[\Delta]{\mathrm{N}_{2} \mathrm{SO}_{4}} \mathrm{~A} \xrightarrow{453-473 \mathrm{~K}} \mathrm{~B}$
(b) Write the chemical reaction of methylamine with benzoyl chloride and write the IUPAC name of the product obtained. $1+1$
(c) Arrange the following in the increasing order of their $p \mathrm{~K}_{b}$ values:

$$
\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2}, \mathrm{NH}_{3}, \mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NH}_{2}, \mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NH}_{2},\left(\mathrm{C}_{2} \mathrm{H}_{5}\right)_{2} \mathrm{NH}
$$

33. (a) Calculate the (i) molality (ii) molarity and (iii) mole fraction of KI if density of $20 \%$ (mass/mass) of aqueous KI solution is $1.202 \mathrm{~g} \mathrm{~mL}^{-1}$.
(b) State Henry's law. Why is air diluted with helium in the tanks used by scuba divers? $1+1$

OR
(a) A solution of glucose in water is labelled as 10 percent $\mathrm{w} / \mathrm{w}$. What would be the molality and mole fraction of each component in the solution ? If the density of the solution is $1.2 \mathrm{~g} \mathrm{~mL}^{-1}$, then what shall be the molarity of the solution?
(b) Why a mixture of acetone and chloroform shows a negative deviation from Raoult's law?
(c) Why osmotic pressure method is preferred for finding molecular mass of macro molecules ?

## SOLUTION

## SECTION - A

1. (i) (d) Aromatic amines are less basic than aliphatic amines. In aqueous solution aliphatic $2^{\circ}$ amine is more basic than $1^{\circ}$ amine.
(ii) (d) Aromatic amines are less basic than aliphatic amines.
(iii) (a) Due to ortho effect o-methylaniline is less basic than aniline.
(iv) (d) $-\mathrm{NO}_{2}$ group with -R effect will decrease the basic character while $-\mathrm{CH}_{3}$ group with +I effect will increase the basic character.

## OR

(c) $o$-Methylaniline or $o$-toluidine will be least basic due to ortho effect.
2. (i) (c) Correct reason : It is due to the adsorption of negatively charged $\mathrm{I}^{-}$ions by the colloidal particles.
(ii) (a) Reason is the correct explanation for assertion.
(iii) (c) Correct reason : The colloidal particles of lyophobic sols are not solvated.
(iv) (a) Reason is the correct explanation for assertion.

## OR

(c) Correct reason : It is due to the adsorption of negatively charged hydroxide ions by the colloidal particles of hydrated ferric oxide.
3. (b) Explanation : $\mathrm{Fe}^{2+}$ with $3 d^{6}$ configuration has four unpaired electrons.
4. (b) Explanation : Element with $3 d^{5}$ configuration will have mximum number (i.e., five) unpaired electrons.
5. (b) Explanation : $\mathrm{X}^{3+}=[\mathrm{Ar}]^{18} 3 d^{5}$. Hence atomic number of element $\mathrm{X}=18+5+3=26$

OR
(a) Explanation : $\mathrm{Cu}(\mathrm{II})$ is more stable than $\mathrm{Cu}(\mathrm{I})$ is aqueous solutions because hydration enthalpy of $\mathrm{Cu}^{2+}$ ion is very high.
6. (d) Explanation : $\mathrm{Ni}^{2+}$ with $3 d^{8}$ configuration will form a tetrahedral complex only with a weak field ligand e.g., $\mathrm{Cl}^{-}$. $\mathrm{Pd}^{2+}$ with $4 d^{8}$ configuration forms a square planar complex with $-\mathrm{N}^{-}$(a strong field ligand). It is mainly due to more diffused shape of $4 d$-orbitals.

$$
\mathrm{Ag}^{+}(a q)+2 \mathrm{CN}^{-}(a q) \longrightarrow\left[\mathrm{OR}(\mathrm{CN})_{2}\right]^{-}(a q)
$$

7. (b) Explanation : Shape of $\mathrm{XeOF}_{4}$ is square pyramidal.
8. (a) Explanation : Out of all the trihalides of nitrogen $\mathrm{NF}_{3}$ is least basic. It is due to high electronegativity of fluorine.
9. (d) Explanation : One molecule of water can form 4 H -bonds, two with O -atom and one H-bond with each of the two H -atoms.

## OR

(b) Explanation : Out of all the halogens, chlorine has the maximum negative electron gain enthalpy.
10. (b) Explanation :

11. (d) Explanation : No. of moles of solute $=\frac{6.02 \times 10^{22}}{6.02 \times 10^{23}}=0.1 \mathrm{~mol}$

$$
\text { Volume of solution }=50 \mathrm{~mL}=0.05 \mathrm{~L}
$$

$$
\text { Molarity }=\frac{\text { No. of moles of solute }}{\text { Vol. of solution (L) }}
$$

$$
=\frac{0 \cdot 1 \mathrm{~mol}}{0 \cdot 05 \mathrm{~L}}=2 \mathrm{~mol} \mathrm{~L}^{-1}=2 \mathbf{M}
$$

OR
(a) Explanation : If the standard electrode potential of an electrode is greater than zero i.e., positive this means that its reduced form is more stable compared to hydrogen gas.
12. (c) Correct reason : Number of ions per unit volume decrease with dilution.
13. (a) Reason is the correct explanation for the assertion.
14. (d) Correct assertion : $\left[\mathrm{Pt}(\text { en })_{2} \mathrm{Cl}_{2}\right]^{2+}$ complex is more stable than $\left[\mathrm{Pt}\left(\mathrm{NH}_{3}\right)_{4} \mathrm{Cl}_{2}\right]^{2+}$ complex.
15. (a) Reason is the correct explanation for the assertion.
16. (d) Correct assertion : Reactivity of ketones of less than aldehydes.

## OR

(c) Correct reason : Aromatic aldehydes and formaldehyle do not have $\alpha$-hydrogen atom.

## SECTION - B

17. $\mathrm{A}+3 \mathrm{~B} \longrightarrow 2 \mathrm{C}$

Average rate of reaction $=-\frac{\Delta[\mathrm{A}]}{\Delta t}=-\frac{1}{3} \frac{\Delta[\mathrm{~B}]}{\Delta t}=\frac{1}{2} \frac{\Delta[\mathrm{C}]}{\Delta t}$

$$
\frac{\Delta[\mathrm{C}]}{\Delta t}=2.5 \times 10^{-4} \mathrm{~mol} \mathrm{~L}^{-1} \mathrm{~s}^{-1} \text { (given) }
$$

$\therefore \quad$ Average rate of reaction $=\frac{1}{2} \times 2.5 \times 10^{-4} \mathrm{molL}^{-1} \mathrm{~s}^{-1}=\mathbf{1 . 2 5} \times \mathbf{1 0}^{\mathbf{- 4}} \mathbf{m o l ~ L}^{\mathbf{- 1}} \mathbf{s}^{\mathbf{- 1}}$
Average rate of disappearance of $\mathbf{B}=-\frac{\Delta[\mathrm{B}]}{\Delta t}=\frac{3}{2} \frac{\Delta[\mathrm{C}]}{\Delta t}$

$$
=\frac{3}{2} \times 2.5 \times 10^{-4} \mathrm{~mol} \mathrm{~L}^{-1} \mathrm{~s}^{-1}=\mathbf{3 . 7 5} \times \mathbf{1 0}^{-4} \mathbf{~ m o l ~ L}{ }^{\mathbf{1}} \mathrm{s}^{\mathbf{- 1}}
$$

18. On heating with dil. $\mathrm{HNO}_{3}$, copper gives copper nitrate and nitric oxide.
$3 \mathrm{Cu}+8 \mathrm{HNO}_{3}($ dil. $) \xrightarrow{\text { Heat }} 3 \mathrm{Cu}\left(\mathrm{NO}_{3}\right)_{2}+4 \mathrm{H}_{2} \mathrm{O}+2 \mathrm{NO}$
Nitric oxide
With conc. $\mathrm{HNO}_{3}$, instead of $\mathrm{NO}, \mathrm{NO}_{2}$ is evolved.
$\mathrm{Cu}+4 \mathrm{HNO}_{3}$ (conc.) $\xrightarrow{\text { Heat }} \mathrm{Cu}\left(\mathrm{NO}_{3}\right)_{2}+2 \mathrm{H}_{2} \mathrm{O}+\underset{\text { Nitrogen dioxide }}{2 \mathrm{NO}_{2}}$
OR
(i) In $\mathrm{NH}_{3}$ the nitrogen atom is $s p^{3}$-hybridised. Three of the four $s p^{3}$-orbitals form three $\mathrm{N}-\mathrm{H}$, $\sigma$-bonds while the fourth contains the lone pair of electrons as shown in the Fig. Since the lone pair-bond pair repulsions are stronger than the bond pair-bond pair repulsions, therefore, in $\mathrm{NH}_{3}$ the bond angle decreases from $109 \cdot 5^{\circ}$ to $107 \cdot 8^{\circ}$. As we move from N to Sb , the electronegativity of the central atom goes on decreasing and hence the bond pairs of electrons lie away and away from the central atom. In other words, bond pair-bond pair repulsion is maximum in $\mathrm{NH}_{3}$ and minimum in $\mathrm{SbH}_{3}$. Consequently, HNH bond angle is maximum $\left(107 \cdot 8^{\circ}\right)$, followed by HPH with bond angle $\left(93 \cdot 6^{\circ}\right)$, HAsH with bond angle of $91 \cdot 8^{\circ}$ while HSbH bond angle $\left(91 \cdot 3^{\circ}\right)$ is the

Fig. Structure of $\mathrm{NH}_{3}$ minimum.
(ii) Both N is $\mathrm{NH}_{3}$ and Bi in $\mathrm{BiH}_{3}$ have a lone pair of electrons on the central atom and hence should behave as Lewis bases. But $\mathrm{NH}_{3}$ is much more basic than $\mathrm{BiH}_{3}$. This can be explained on the basis of electron density on the central atom. Since the atomic size of $\mathrm{N}(70 \mathrm{pm})$ is much smaller than that of $\mathrm{Bi}(148 \mathrm{pm})$, therefore, electron density on the N -atom is much more than that on Bi-atom. Consequently, the tendency of N in $\mathrm{NH}_{3}$ to denote its pair of electrons is much higher than that of Bi in $\mathrm{BH}_{3}$. Thus, $\mathrm{NH}_{3}$ is much more basic than $\mathrm{BiH}_{3}$.

| S.No. | Lyophilic Colloids | Lyophobic Colloids |
| :---: | :---: | :---: |
| 1. | Ease of preparation. Form easily by mere shaking or warming of dispersed phase and dispersion medium. No stabilizer if needed. | Difficult to prepare. They are formed only by special methods. Needs the addition of a stabilizer. |
| 2. | Nature of particles. Particles are solvent loving and are in the form of single molecules. | Particles are solvent hating and are in the form of aggregates of large number of associated molecules. |
| 3. | Viscosity. Higher than that of dispersion medium. | About the same as that of dispersion medium. |
| 4. | Stability. Very stable. | Poor stability. |
| 5. | Action of electrolytes. Coagulation possible only by adding a large quantity of electrolyte. | Coagulation possible even with a very small amount of electrolyte. |
| 6. | Surface tension. Less than that of dispersion medium. | Same as that of dispersion medium. |
| 7. | Nature of coagulation. The coagulation is reversible | The coagulation is irreversible. |

## OR

(i) Associated colloids (Micelles). They behave as normal strong electrolytes at low concentration but show colloidal properties at higher concentrations i.e., these get associated to give micelles e.g., soap. Formation of micelle takes place above a certain concentration called critical miceller concentration (CMC) and above a particular temperature called Kraft temperature $\left(\mathrm{T}_{k}\right)$. When the solution has less concentration than CMC, it behaves as normal electrolyte as the micelle become unstable on dilution.
(ii) Multimolecular colloids. These colloidal solution consists of aggregates of atoms or small molecules with diameter less than $10^{3} \mathrm{pm}$. The colloidal particles are held by weak van der Waal forces e.g., colloidal sol of sulphur, gold, silver etc.
20. (a) $\left[\mathrm{CoF}_{6}\right]^{3-}$

IUPAC Name : hexafluoridocobaltate(IV) ion.
$\operatorname{Co}(\mathrm{Z}=27):[\mathrm{Ar}]^{18} 4 s^{2} 3 d^{7}$
$\mathrm{Co}^{3+}:[\mathrm{Ar}]^{18} 3 d^{6}$
Fluoride ion is a weak field ligand. Hence no pairing. Thus hybridisation is $s p^{3} d^{2}$.
(b) In $\left[\mathrm{Ni}(\mathrm{CO})_{4}\right]$, Ni is in zero oxidation state whereas in $\left[\mathrm{NiCl}_{4}\right]^{2-}$, it is in +2 oxidation state. In the presence of CO ligand, the unpaired $d$-electrons of Ni pair up but $\mathrm{Cl}^{-}$being a weak ligand is unable to pair up the unpaired electrons.
21.

| S.No. | Globular protein | Fibrous protein |
| :---: | :--- | :--- |
| 1. | These proteins consist of molecules which are exten- <br> sively folded into compact units approaching almost <br> spherical shapes. | These proteins consist of linear thread like molecules <br> which lie side by side. |
| 2. | Hydrogen bonding and van der Waal's interaction <br> exist between different parts of polypeptide chain. | There is formation of extensive hydrogen bonding <br> between neighbouring chains. <br> They are insoluble in water. <br> They are soluble in water. |
| 4. | They function as enzymes, regulate metabolic <br> processes and act as antibodies. | They serve as the chief structural material of animal <br> tissues. |

22. (i) Finkelstein reaction. An alkyl iodide may be prepared by treating an alkyl chloride or bromide with sodium iodide in acetone. The chlorine or bromine atom of the alkyl halide is replaced iodine atom in the reaction.

(ii) Hunsdiecker reaction. This reaction consists of the decomposition of silver salt of a caboxylic acid by chlorine or bromine in carbon tetrachloride solution to form an alkyl or aryl halide with one carbon atom less than the original acid.

$$
\mathrm{RCOOAg}+\mathrm{Br}_{2} \xrightarrow[350 \mathrm{~K}]{\mathrm{CCl}_{4}} \mathrm{R}-\mathrm{Br}+\mathrm{AgBr}+\mathrm{CO}_{2} \uparrow
$$

Silver salt of
carboxylic acid

(i) Etard reaction : It involves oxidation of toluene with chromyl chloride $\left[\mathrm{CrO}_{2} \mathrm{Cl}_{2}\right]$. Chromyl chloride oxidises methyl group to a chromium complex, which on hydrolysis gives benzaldehyde.

(ii) Gatterman Koch reacton : When benzene or its derivative is treated with CO and $\mathrm{HCl}(g)$ in the presence of anhydrous $\mathrm{AlCl}_{3}$ or $\mathrm{Cu}_{2} \mathrm{Cl}_{2}$ it gives benzaldehyde or substituted benzaldehyde.

23. $6 \mathrm{XeF}_{4}+12 \mathrm{H}_{2} \mathrm{O} \rightarrow 4 \mathrm{Xe}+2 \mathrm{XeO}_{3}+24 \mathrm{HI}+3 \mathrm{O}_{2}$

Yes. It is a disproportionation reaction because $\mathrm{O} . \mathrm{S}$. of Xe in $\mathrm{XeF}_{4}$ is +4 which decreases to zero in Xe (reduction) and simultaneously increases to six in $\mathrm{XeO}_{3}$ (oxidation).
24. Cell representation is :

$$
\mathrm{Ni} 1 \mathrm{Ni}^{2+}(1 \mathrm{M}) \| \mathrm{Ag}^{+}(1 \mathrm{M}) \mid \mathrm{Ag}
$$

Here $n=2, \mathrm{E}^{\circ}{ }_{\mathrm{Ni}^{2+} / \mathrm{Ni}}=-0.25 \mathrm{~V}, \mathrm{E}_{\mathrm{Ag}^{+} / \mathrm{Ag}}=+0.80 \mathrm{~V}$

$$
\begin{aligned}
\mathrm{E}_{\text {cell }}^{\circ} & =\mathrm{E}_{\mathrm{Ag}^{+} / \mathrm{Ag}}^{\circ}-\mathrm{E}_{\mathrm{Ni}^{2+} / \mathrm{Ni}}^{\circ}=[+0 \cdot 80-(-0 \cdot 25)] \mathrm{V} \\
& =[+0 \cdot 80+0 \cdot 25] \mathrm{V}=1 \cdot 05 \mathrm{~V}
\end{aligned}
$$

At 298 K

$$
\begin{aligned}
\mathrm{E}_{\text {cell }}^{\circ} & =\frac{0 \cdot 059}{n} \log \mathrm{~K}_{c} \\
\log \mathrm{~K}_{c} & =\frac{n \times \mathrm{E}_{\text {cell }}^{\circ}}{0.059} \\
& =\frac{2 \times 1.05}{0.059}=\mathbf{3 5 . 5 9}
\end{aligned}
$$

25. When $40 \%$ complete :
$[\mathrm{R}]_{0}=100$ (say), $[\mathrm{R}]=100-40=60, t=80 \mathrm{~min}$.
For a first order reaction

$$
\begin{aligned}
k & =\frac{2 \cdot 303}{t} \log \frac{[\mathrm{R}]_{0}}{[\mathrm{R}]} \\
& =\frac{2 \cdot 303}{80 \mathrm{~min}} \log \frac{100}{60}=\frac{2 \cdot 303}{80 \mathrm{~min}} \log \frac{5}{3} \\
& =\frac{2.303}{80 \mathrm{~min}}[\log 5-\log 3]=\frac{2.303}{80 \mathrm{~min}}[0.6990-0.4771] \\
& =\frac{2.303}{80 \mathrm{~min}} \times 0.2219=6.4 \times 10^{-3} \mathrm{~min}^{-1}
\end{aligned}
$$

For 90\% completion

$$
\begin{aligned}
{[\mathrm{R}]_{0} } & =100(\text { say }),[\mathrm{R}]=100-90=10, k=6 \cdot 4 \times 10^{-3} \mathrm{~min}^{-1} \\
t & =\frac{2 \cdot 303}{k} \log \frac{[\mathrm{R}]_{0}}{[\mathrm{R}]} \\
& =\frac{2.303}{6 \cdot 4 \times 10^{-3} \mathrm{~min}^{-1}} \log \frac{100}{10}=\frac{2.303}{6.4 \times 10^{-3} \mathrm{~min}^{-1}} \log 10 \\
& =\frac{2.303}{6 \cdot 4 \times 10^{-3}} \min =\mathbf{3 6 0} \text { min } \text { (approx) }
\end{aligned}
$$

26. (i) Compounds $\mathrm{A}\left(\mathrm{C}_{8} \mathrm{H}_{8} \mathrm{O}\right)$ gives positive DNP and iodoform test. This indicates that it contains $\mathrm{CH}_{3}-\mathrm{CO}$-group.
(ii) It does not reduce Tollen's or Fehling's reagent. It shows that it is not an aldehyde.
(iii) It does not decolourise $\mathrm{Br}_{2}$ water. This indicates that it behaves as a saturated compound.
(iv) On oxidation with chromic acid it is oxidised to carboxylic acid $\mathbf{B}\left(\mathrm{C}_{7} \mathrm{H}_{6} \mathrm{O}_{2}\right)$. It is possible only if $\mathbf{B}$ is benzoic acid, $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COOH}$.
This indicates that $\mathbf{A}$ is acetophenone with the following structure :

The sequence of reactions can be written as follows :

OR
(i)

27.

(ii)

28.
(a)

(b)

OR
(i)

Sod. phenoxide

$o$-Hydroxybenzoic acid
(ii) $\mathrm{CH}_{3} \mathrm{COCH}_{3} \xrightarrow{\mathrm{LiAlH}_{4}} \mathrm{CH}_{3} \mathrm{CH}(\mathrm{OH}) \mathrm{CH}_{3} \xrightarrow[443 \mathrm{~K}]{\mathrm{H}_{2} \mathrm{SO}_{4} \text { (conc) }} \mathrm{CH}_{3} \mathrm{CH}=\mathrm{CH}_{2}$
(iii)

29.

(ii)

(iii)

30. $z=4$ (f.c.c. lattice), $a=3.608 \times 10^{-8} \mathrm{~cm}, d=8.96 \mathrm{~g} / \mathrm{cm}^{3}, \mathrm{~N}_{\mathrm{A}}=6.022 \times 10^{23} \mathrm{~mol}^{-1}, \mathrm{M}=$ ?

$$
\begin{aligned}
d & =\frac{z \times \mathrm{M}}{a^{3} \times \mathrm{N}_{\mathrm{A}}} \text { or } \mathrm{M}=\frac{d \times a^{3} \times \mathrm{N}_{\mathrm{A}}}{z} \\
\mathrm{M} & =\frac{\left(8.96 \mathrm{~g} \mathrm{~cm}^{-3}\right) \times\left(3.608 \times 10^{-8} \mathrm{~cm}\right)^{3} \times\left(6.022 \times 10^{23} \mathrm{~mol}^{-1}\right)}{4}=63.1 \mathrm{~g} \mathrm{~mol}^{-1}
\end{aligned}
$$

$\therefore$ Atomic mass of copper $=63 \cdot 1 \mathbf{u}$
31. (a) (i) Helium does not form compounds like xenon because ionisation enthalpy of helium is very high.
(ii) $\mathrm{H}-\mathrm{OCl}+\mathrm{H}_{2} \mathrm{O} \longrightarrow \mathrm{H}_{3} \mathrm{O}^{+}+{ }^{-} \mathrm{O}-\mathrm{Cl}$
$\mathrm{H}-\mathrm{OClO}_{3}+\mathrm{H}_{2} \mathrm{O} \longrightarrow \mathrm{H}_{3} \mathrm{O}^{+}+{ }^{-} \mathrm{O}-\mathrm{ClO}_{3}$
Due to resonance, ${ }^{-} \mathrm{O}-\mathrm{ClO}_{3}$ ion is more stable than ${ }^{-} \mathrm{O}-\mathrm{Cl}$, hence $\mathrm{HClO}_{4}$ is a stronger acid than HOCl .
(iii) It is due to the folloiwng two reasons :
(a) Oxygen can form $p \pi-p \pi$ multiple bond more effectively than sulphur.
(b) The - $\ddot{\mathrm{O}}-\ddot{\mathrm{O}}-$ bond is weaker than $-\underset{\mathrm{S}}{-\mathrm{S}}-\underset{\mathrm{S}}{ }-$ bond
(b) (i) Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$ as an oxidising agent : Hot conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$ oxidises carbon to carbon dioxide.

$$
\begin{aligned}
& \mathrm{H}_{2} \mathrm{SO}_{4}\left.\longrightarrow \mathrm{H}_{2} \mathrm{O}+\mathrm{SO}_{2}+\mathrm{O}\right] \times 2 \\
& \mathrm{C}+2[\mathrm{O}] \mathrm{CO}_{2} \\
& \hline 2 \mathrm{H}_{2} \mathrm{SO}_{4}+\mathrm{C} \longrightarrow 2 \mathrm{H}_{2} \mathrm{O}+2 \mathrm{SO}_{2}+\mathrm{CO}_{2} \\
& \hline
\end{aligned}
$$

(ii) conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$ as a dehydrating agent. Hot conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$ dehydrates oxalic acid to a mixture of carbon monoxide and carbon dioxide.

COOH
Oxalic acid

## OR

(a) (i) Hydration enthalpy of $\mathrm{F}^{-}$ion is more than $\mathrm{Cl}^{-}$ion because $\mathrm{F}^{-}$ion is smaller than $\mathrm{Cl}^{-}$ion.
(ii) $\mathrm{SO}_{2}$ is a reducing agent while $\mathrm{TeO}_{2}$ is an oxidising agent because sulphur is more stable in +6 oxidation state while tellurium is more stable in +4 oxidation state (inert pair effect).
(b)

$$
2 \mathrm{~F}_{2}+2 \mathrm{H}_{2} \mathrm{O} \longrightarrow 4 \mathrm{HF}+\mathrm{O}_{2}
$$

$\mathrm{I}_{2}$ can not react with water because $\mathrm{I}_{2}$ is a weak oxidising agent.
(c) Structure of $\mathrm{XeF}_{2}$

32. (a) (i) Nitration of aniline is done with nitrating mixture (conc. $\mathrm{HNO}_{3}+$ conc. $\mathrm{CH}_{2} \mathrm{SO}_{4}$ ). The $\mathrm{H}^{+}$ions from these acids protonate the $-\mathrm{NH}_{2}$ group of aniline to form anilinium ion.

The $-\mathrm{NH}_{3}$ group is deactivating and $m$-directing in nature due to its election withdrawing effect.
(ii) A $2^{\circ}$ alkylamine is more basic than a $3^{\circ}$ alkylamine in aqueous medium. This is due to the combined effect of solvation (H-bonding with water molecules) and election donating effect of alkyl groups.
(iii) Ammonolysis of alkyl halides give a mixture of $1^{\circ}, 2^{\circ}$ and $3^{\circ}$ amines along with quaternary ammonium salts. Thus this method is not suitable to prepare pure $1^{\circ}$ amines.
(b) (i) On heating with chloroform $\left(\mathrm{CHCl}_{3}\right)$ and KOH (alc.), $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{NH}_{2}$ gives a foul smelling isocyanide while $\left(\mathrm{CH}_{3} \mathrm{CH}_{2}\right)_{2} \mathrm{NH}$ does not. This is because $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{NH}_{2}$ is a $1^{\circ}$ amine while $\left(\mathrm{CH}_{3} \mathrm{CH}_{2}\right)_{2} \mathrm{NH}$ is a $2^{\circ}$ amine.
(ii) On adding ice cold solution of benzene diazonium chloride to aniline in an acidic medium, a yellow coloured dye is obtained. On the other hand, in case of $\mathrm{CH}_{3} \mathrm{NH}_{2}$ no such dye formation takes place.

OR
(a)

Molarity $=\frac{\text { Moles of solute }}{\text { Volume of solution }(\mathrm{L})}=\frac{0.0555 \mathrm{~mol}}{0.0833 \mathrm{~L}}=0.67 \mathrm{molL}^{-1}=\mathbf{0 . 6 7} \mathbf{M}$
(b) Both chloroform and acetone cannot take part in hydrogen bonding when present alone. But when chloroform and acetone are mixed, the hydrogen bonding takes place between the two as explained below :

Due to hydrogen bonding escaping tendencies of both the liquids become less and as such the mixture shows a negative deviation from Raoult's law.
(c) As the molecular masses of macro-molecules are of the order of $10^{6}$ a.m.u., the molality of the solution taken is very low. For such solutions, other methods like elevation in boiling point, depression in freezing point etc., cannot be used because changes measured in these properties are very small and thus cannot be accuratelly measured. On the other hand, osmotic pressure for such solutions can be easily measured due to its much larger magnitude.
